

SHARP

Version 1.4
Produced in Nov. 2000

Programmable controller

New Satellite JW

Model name

JW50H/70H/100H

User's Manual/Hardware version

We thank you for your purchase of the SHARP programmable controller new satellite JW50H/70H/100H.

This booklet (user's manual, hardware version) explains mainly the JW30H's hardware; the system configuration, specifications, installation method etc.

Carefully read this user's manual, hardware version and the JW50H/70H/100H instruction manual attached to the system module of JW50H/70H/100H so that you are able to operate JW50H/70H/100H properly, having thoroughly familiarized yourself with the functions of the system module and their operation method.

Keep this user's manual, hardware version with you together with the JW50H/70H/100H instructions manual.

We are confident that these booklets will be helpful whenever you face problem.

Please refer to the programming manual ladder instruction version or programming manual.

Note

When first powering up the JW50H/70H/100H, be sure to use a support tool and follow the procedures below to clear the system memory and program memory, and to perform auto I/O module registration of the relay numbers of the I/O module.

- To use the high speed compatible JW-11PG, JW-12PG/13PG/14PG, JW-100SP, JW-50SP, JW-40PG, and JW-50PG as support tool.

- To use the high speed non-compatible JW-10PG/11PG, JW-30PG/32PG, ZW-101PG1, ZW-100LP2S as support tool.

Note

- This module is made in accordance with Japanese domestic specifications. Its guarantee clauses are described in a separate guarantee card (packed together with the module). When this module is used outside Japan, these guarantee clauses are not applicable. In addition, the guarantee should be understood as a guarantee of the delivered product as a single unit and every other damages or losses due to damage or malfunction of the product will not be included in this guarantee.
- Should you have any questions and inquiries, please feel free to contact our dealers.
- The whole or partial photocopy of this booklet is prohibited.
- Contents of this booklet may be revised for improvement without notice.

Safety precautions

Read this manual and attached documents carefully before installation, operation, maintenance and checking in order to use the machine correctly. Understand all of the machine knowledge, safety information, and cautions before starting to use. In this instruction manual, safety precautions are ranked into "danger" and "caution" as follows.

 **Danger** : Wrong handling may possibly lead to death or heavy injury.

 **Caution** : Wrong handling may possibly lead to medium or light injury.

Even in the case of  **Caution**, a serious result may be experienced depending on the circumstances. Anyway, important points are mentioned. Be sure to observe them strictly.

The picture signs of Prohibit and Compel are explained below.

 : It means don'ts. For example, prohibition of disassembly is indicated as ().

 : It means a must. For example, obligation of grounding is indicated as ().

1) Installation

Caution

- Use in the environments specified in the catalog and instruction manual.
Electric shock, fire or malfunction may be caused when used in the environments of high temperature, high humidity, dusty or corrosive atmosphere, vibration or impact.
- Install according to the manual.
Wrong installation may cause drop, trouble or malfunction.
- Never admit wire chips or foreign matter
Or fire, trouble or malfunction may be caused.

2) Wiring

Compel

- Be sure to ground.
Unless grounded, electric shock or malfunction may be caused.

Caution

- Connect the rated power source.
Connection of a wrong power source may cause a fire.
- Wiring should be done by qualified electrician.
Wrong wiring may lead to fire, trouble or electric shock.

3) Use

Danger

- Don't touch the terminal while the power is being supplied or you may have on electric shock.
- Assemble the emergency stop circuit and interlock circuit outside of the programmable controller. Otherwise breakdown or accident damage of the machine may be caused by the trouble of the programmable controller.

Caution

- "Run" or "stop" during operation should be done with particular care by confirming safety. Misoperation may lead to damage or accident of the machine.
- Turn ON the power source in the specified sequence. Turn ON with wrong sequence may lead to machine breakdown or accident.

4) Maintenance

Danger

- Never connect battery in wrong polarity, or charge, disassemble, heat, throw into fire, or short-circuit. Or it may be broken or ignited.
- Do not subject the battery to impact of any kind. Do not pull on the lead wires of the battery, or liquid leakage accident may occur.

Prohibit

- Don't disassemble or modify the modules.
Or fire, breakdown or malfunction may be caused.

Caution

- Turn OFF the power source before detaching or attaching the module.
Or electric shock, malfunction or breakdown may be caused.
- Replace with the fuses in specified ratings only.
Or fire, breakdown may be caused.

This manual covers systems of JW50/70/100.

- The difference between the JW50/70/100 and JW50H/70H/100H is the control module used in the system.

	Control module in use
JW50	JW-50CU
JW70	JW-70CU
JW100	JW-100CU
JW50H	JW-50CUH
JW70H	JW-70CUH
JW100H	JW-100CUH

- Compared to the JW50/70/100, functions ① to ⑨ shown below have been enhanced or added in the JW50H/70H/100H.

Function	See page
① Faster processing speed	4-13
② Additional application instructions	4-13
③ Increased number of timers and counters	4-14
④ Additional memory modules	4-20
⑤ Enhanced memory protect switch function	4-10
⑥ Additional ROM operation mode	7-1
⑦ Simplified activate operation	Previous page
⑧ Improved communication port	4-103 to 107
⑨ H-series compatibility for support tools	10-1

- See the programming manual for details on the processing speed and application instructions etc.

Note

- The additional functions of the JW50H/70H/100H(compared with JW50/70/100) are not available if they are used together with the communication modules listed below and the computer link and remote programming and monitoring are used.

[Communication modules]

ZW-20CM, ZW-20RS, ZW-10CM, ZW-20CM2,
ZW-30CM, ZW-98CM (version 3.0 or less), ZW-20AX(version 1.0)

[Additional functions]

1. If the memory protect switch is ON, the mode change(run/halt, etc.) of the PC is disabled.
2. Expanded timers and counters (1000 to 1777: 512 points)
3. Additional application instructions
 - Fx ○○ :Hexadecimal constant arithmetic
 - F-22 to 29, F-34 to 38, F-67 to 69
 - F-260/Fc-260, F-261/Fc261

[1] Read commands 12-40

[2] Write commands 12-42

[3] Control commands 12-44

Chapter 1. Overview

This manual describes the specifications and operation of the individual functional components of the new satellite series JW50/70/100, JW50H/70H/100H.

As the nucleus of a new generation of flexible automation systems, the PC provides enhanced features and speed in data communications, information processing, and system maintenance.

■ Features

1. Faster processing speed, increased number of timers and counters and enhanced application instructions

Compared to the JW50/70/100, the JW50H/70H/100H features the following enhanced functions.

- 50% increase in processing speed
- Increase from 512 timers and counters to 1024
- Expansion from 116 application instructions to 157

2. Enhanced data processing capability

- Data width has been increased to 8/16/32 bits.
- Data retrieve, replace, insert, delete, ASCII conversion, and other data manipulation instruction have been enhanced.
- In addition to the existing general I/O refresh instruction, another features, these instructions allow increased processing throughput.

3. Enhanced communication features

- The enhanced satellite net capabilities have enabled the PC to start up a communication sequence with a dedicated send/receive instruction.
- Equipped with a SUMINET(note) interface, an optical local area network.
- The satellite I/O link allows the PC to be connected to scattered factory automation devices through a single twisted-pair cable to each device. This significantly reduces field cabling manpower requirements and installation overhead.

4. Enhanced I/O bus

- Data is transferred between the PC and spacial I/O module during the I/O refresh. This eliminates the need for a separate data transfer program.
- There is no restriction on device address allocations to I/O modules, provided they are used in separate cages.
- The I/O bus extension adapter allows an expansion rack panel to be situated up to 50m from the PC rack panel, enabling real-time remote I/O operation. Since a programming terminal can be connected to the expansion rack panel, the program can be monitored in the field, where the expansion rack panel is installed.
- The enhanced diagnostic features include input data parity check, output data check, installed module check, and others.

5. Reduced burn-in overhead

- Remote monitoring and processing are allowed across networks with different hierarchical levels.
- Extensive debugging features available include: sampling trace, break monitor, step-by-step execution, forced I/O ON/OFF control, and others.
- On an error condition, the system automatically registers the error code, time and data.
- A support tool allows replacement of any I/O module, with the exception of special I/O modules, with the system power left turned ON.
- I/O indicators allow the I/O modules' device addresses to be checked at a glance.

(Note) SUMINET is a trademark of Sumitomo Electric Industry Co., Ltd.

Chapter 2. Safety precautions

When handling or operating the PC, keep the following precautions in mind:

■ Installation

Avoid keeping the PC in the following conditions:

- Direct sunlight or temperature extremes outside the range of 0 to 55 degrees.
- Relative humidity which exceeds 35 to 90 %. No condensation due to rapid temperature variation.
- Corrosive and flammable gases.
- Vibration or hard jolts.

■ Grounding

- Prepare a class-3 grounding of the PC separately. Never co-ground with high power equipment grounding lines (see page 6-1).

■ Module Installation

- Securely fasten the retaining screws in each module.
- Firmly connect cable (I/O expansion cable), connecting to the basic/expansion rack panel. Confirm connectors are fastened prior to supplying power. Looseness may cause malfunction.
- Each module has a ventilation hole to allow for cooling. Do not block the holes.

■ Wiring

- Take special care to avoid cross connection of the 5VDC and 24VDC supplies to the basic rack panel to an expansion rack panel or expansion rack panels to each other. Looseness of screws may cause malfunction.
- Keep the input/output lines away from high voltage or strong current lines such as power lines.

■ Cautions for static electricity

- Significant volume of static electricity may build up on the human body in extremely dry conditions. Prior to touching the module, discharge the static electricity by touching grounded metals.

■ Cleaning

- Use the soft cloths for cleaning. Volatile solvents (alcohol, paint thinner, freon etc.) and wet rags may cause deformation or change of color.

■ Storage

- Keep the control module in cool and dry conditions as it is equipped with a battery for memory backup. High ambient temperature may shorten its battery life.

■ Other precautions

- Use separate relay logic for the emergency stop control. The relay logic should include a circuit which will shut off the PC output in an emergency.
- Do not apply excessive operating stress to switches and connectors.
- The following table lists the maximum number of input/output relay contacts, program memory capacity, and file memory capacity available:

Model	Max. No. of I/O points	Program memory capacity	File memory capacity
JW50, JW50H	512	7.5K words	16K words
JW70, JW70H	1024	63K words max.(note)	448K bytes max.(note)
JW100, JW100H	4096 (using JW-I/O) 2048 (using ZW-I/O)		

(Note) Optional memory modules are available for the JW70/100, JW70H/100H. For more details, see page 4-20.

- Never attempt to install or remove a control module, option module, or I/O module with the system power ON. Permanent damage to on-board memories or other circuit devices may result.

Note A support tool placed in the "Live I/O replace" mode allows you to replace an I/O module with the system power left turned ON. For more details, see page 9-3.

- The PC's watchdog timer is set to an interval of 320ms. If the scan time exceeds this interval, the halt output contacts will be opened. (For details on scan time, see the programming manual 2-7[3](9), "Scan time").
- The type of I/O modules used must be specified in the control module using the DIP switches (see page 4-2). Either JW-I/O or ZW-I/O modules may be used with the control module.

Table of switch setting (in case of JW-50CU/70CU/100CU)

	ZW-I/O		JW-I/O
	All OFF	Output hold	Output hold
SW2-1	OFF	ON	ON
SW2-2	OFF	OFF	ON

JW-I/O: I/O module dedicated to JW50H/70H/100H

ZW-I/O: I/O module designed for use in conventional W51, W70H, and W100

■ At initial power ON

- When first powering up the PC, the contents of the memory module installed in the PC are underfined and the I/O installation configuration is not stored in the system memory. Use a support tool to clear the system memory and program memory and to perform auto I/O registration of the relay numbers for the I/O module. Refer to the page following the table of contents for the procedure.

■ Installing the module

Do not force and bend the pin when installing the module to the connector at the rack panel.

■ When AC power is used

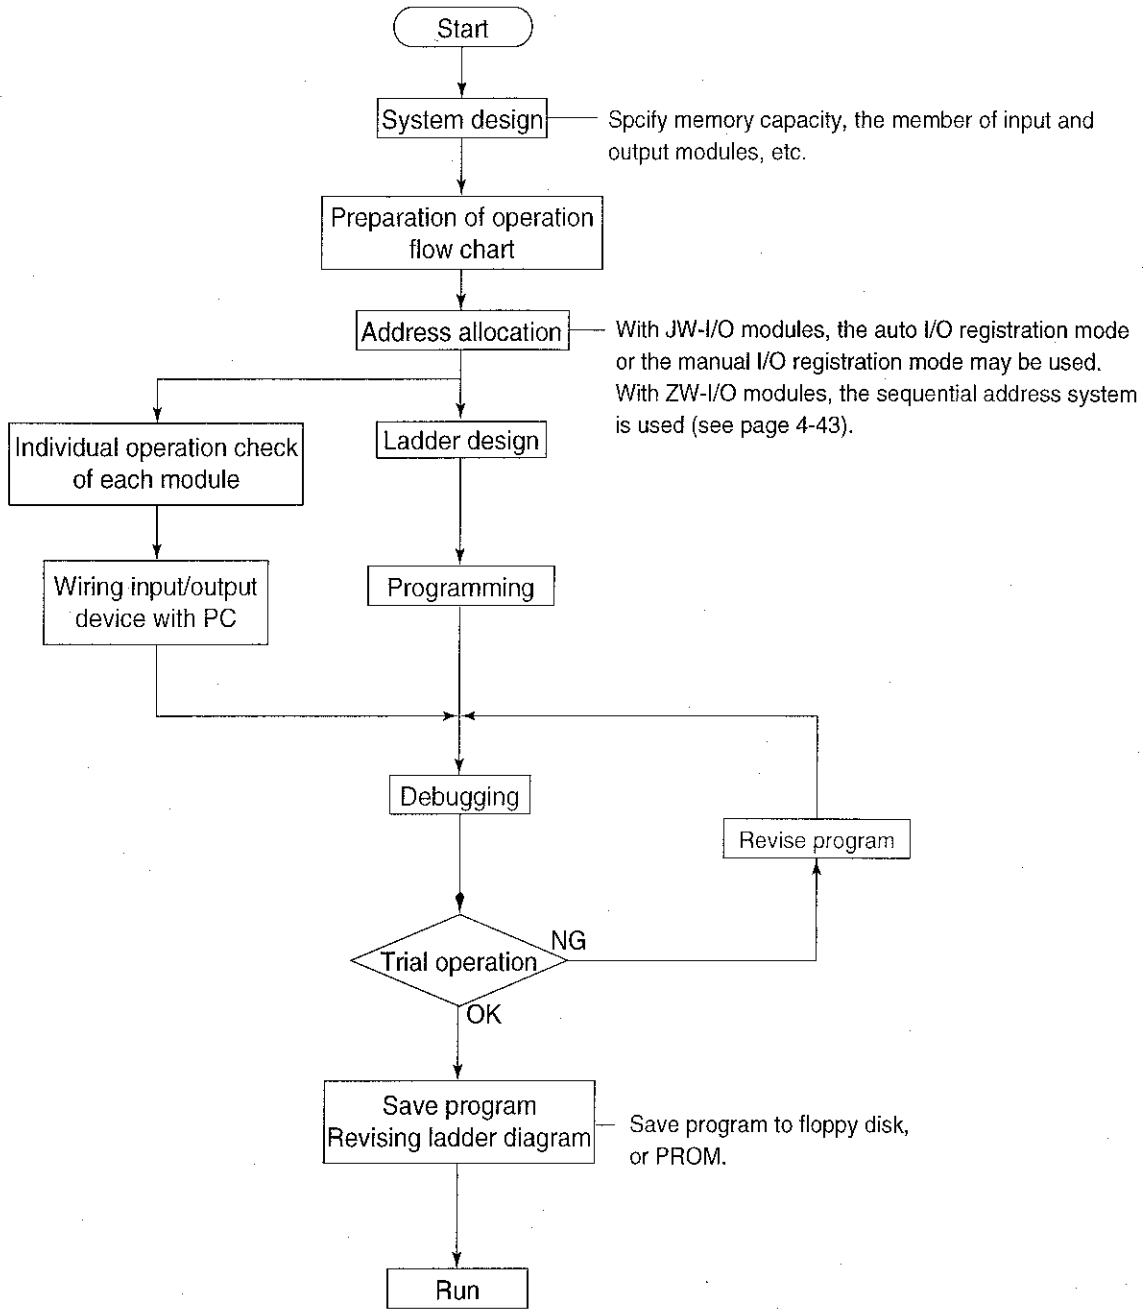

Connect the INPUT terminal of power supply module JW-1PU pay attention to LIVE terminal (non-grounding) and NEUTRAL terminal (grounding).

Chapter 3. System design and general specifications

3-1 System design procedure

The system design procedure is virtually as the same as those of the other conventional relay controllers. The following is an example of the system design procedure of the PC. The following shows a sample design sequence for a system including the PC.

3-2 Cautions on system design

A principle difference between a programmable controller (PC) and a conventional relay circuit is that a PC controls each operation cyclically (in series), whereas relay circuit controls it in parallel.

Therefore, relay circuits limit the effect of an abnormal operation to a block.

However, a PC allows abnormal operations of the whole system when an abnormal condition occur.

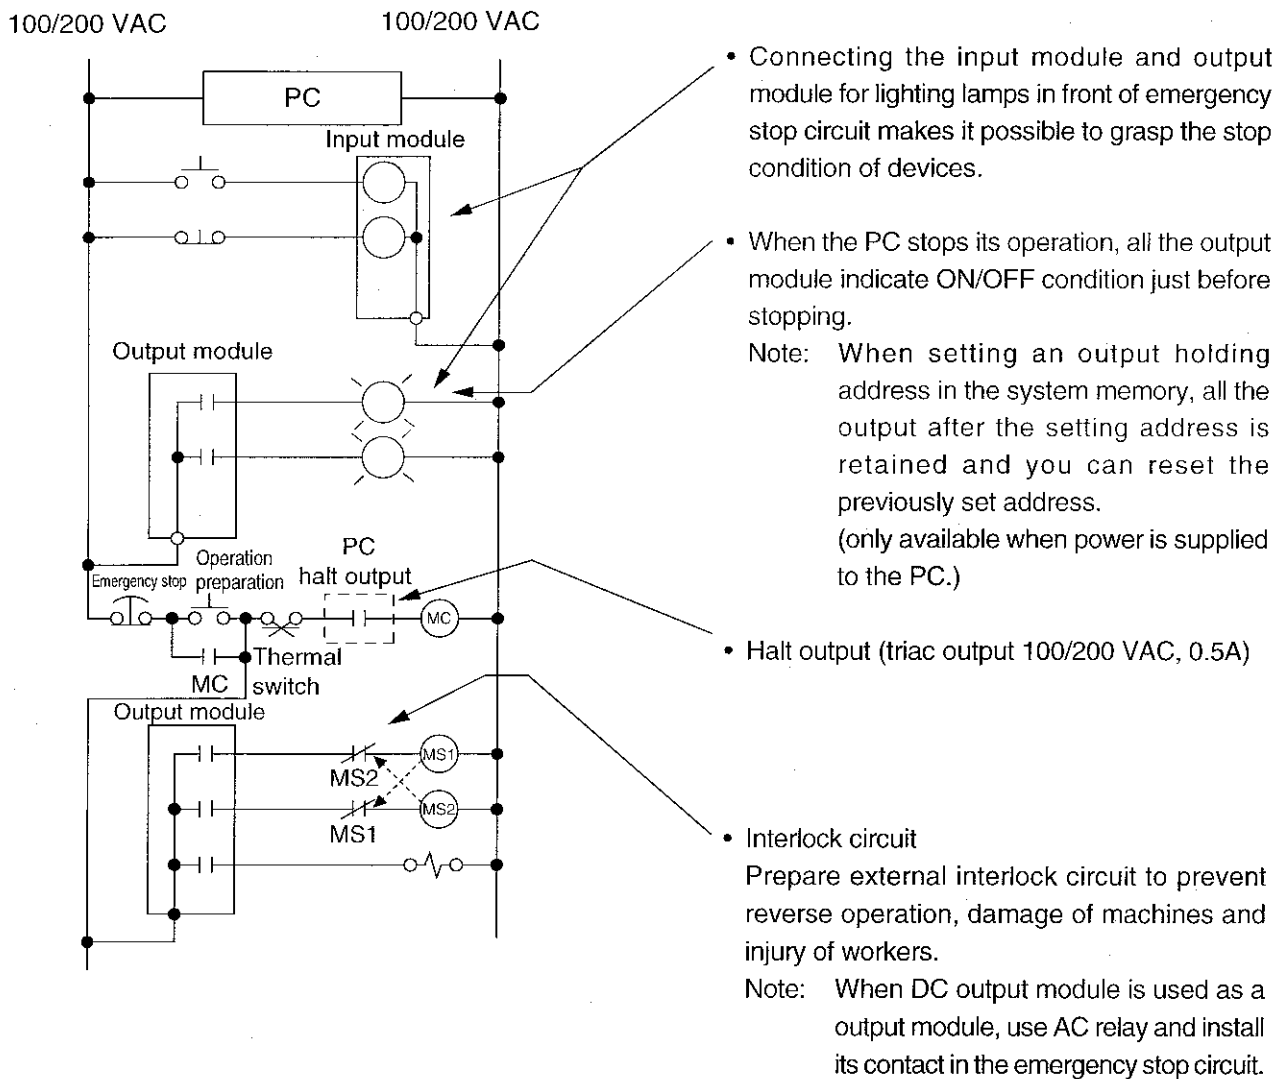

In order to create a fail-safe system, we recommend preparing independent external protective circuits for following functions, which may cause a breakdown of machine or injury to workers:

- Emergency stop circuit,
- Protection circuit,
- Operating circuit of high voltage device.

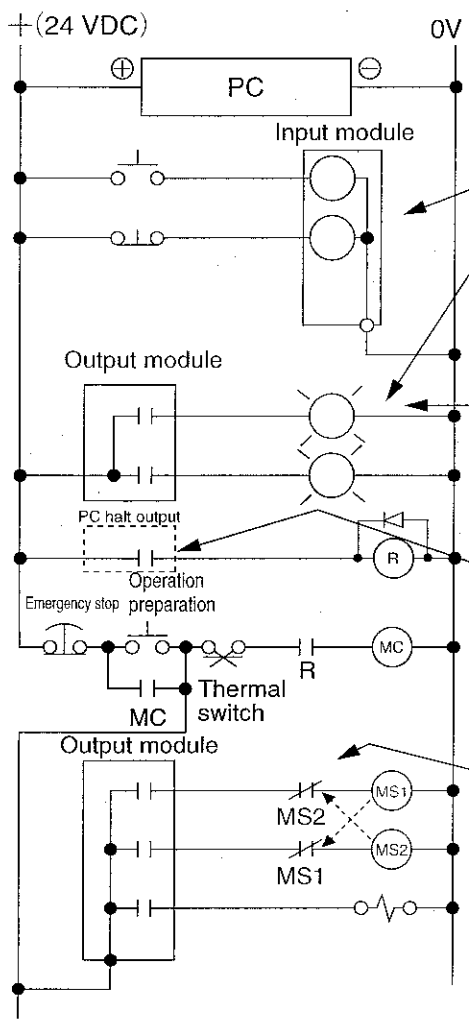

Also, be aware of the operation response time, as a PC operates using cyclic processing.

To prevent mis-operation due to output signal of the output module soon after switching on power to the PC, connect in series the halt output for the PC in the following operation stand-by circuit. (The shutoff circuit will open its gate approximately 1 second after the PC is turned ON.)

[In case of using AC power supply]

[In case of using DC power supply] *Note 1

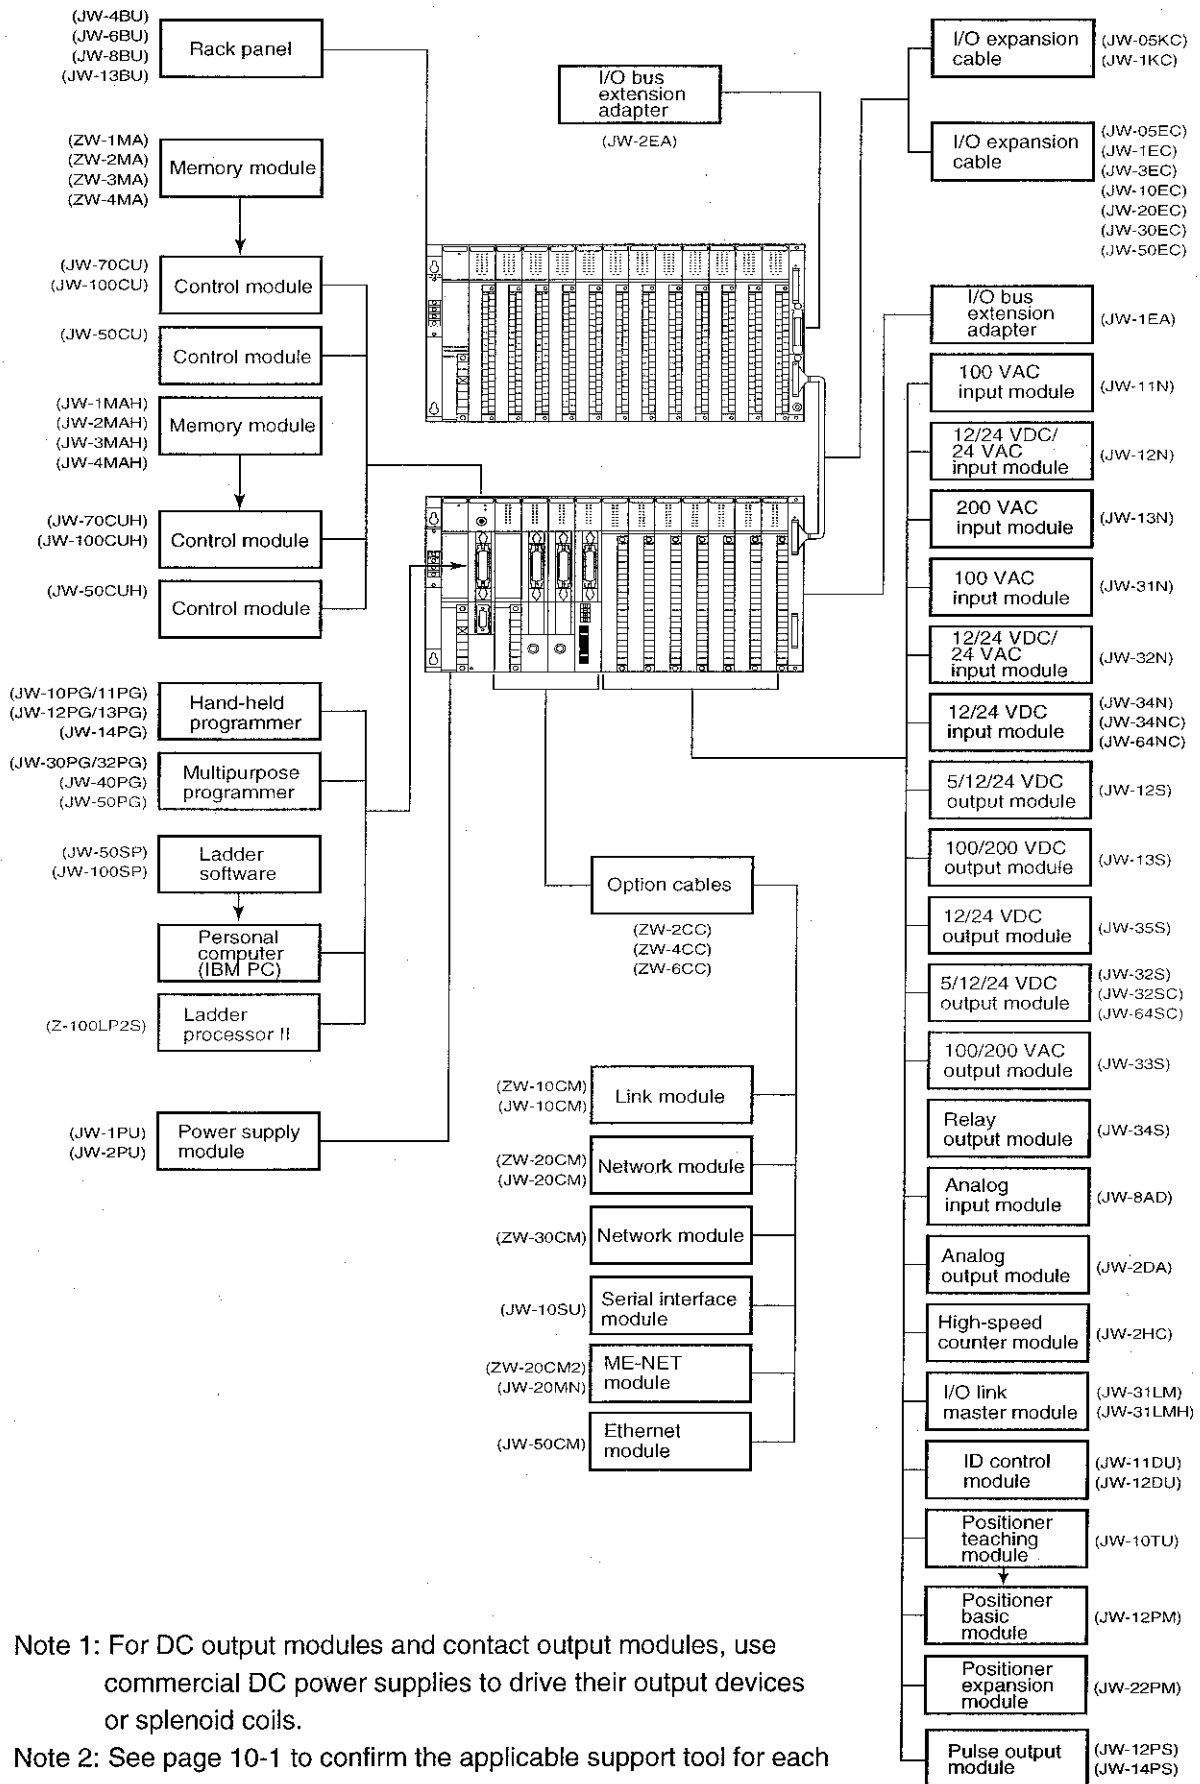

- Connecting an input module and output module for lighting lamps in front of emergency stop circuit makes it possible to grasp the stop condition of devices.
- When the PC stops its operation, all the output module indicate ON/OFF condition just before stopping.
Note: When setting an output holding address in the system memory, all the output after the setting address is retained and you can reset the previously set address. (only available when power is supplied to the PC.)
- Halt output (transistor rated at 24VDC, 0.5A) (Note 1). Use this output to drive an external relay, and insert the relay contacts into the emergency stop circuit in series.
- Interlock circuit
Prepare external interlock circuit to prevent reverse operation, damage to machines and injury of workers.

*Note 1: The JW-2PU power supply module is used.

3-3 System configuration

[1] Basic system configuration using JW-I/O modules

Note 1: For DC output modules and contact output modules, use commercial DC power supplies to drive their output devices or splenoid coils.

Note 2: See page 10-1 to confirm the applicable support tool for each control module.

[2] Basic system configuration using ZW-I/O modules

Note 1: The ZW-100PU1 and ZW-100PU2 expansion power supply modules have difference capacities. Use them within their respective current capacities.

Note 2: For DC output modules and contact output modules, use commercial DC power supplies to drive their output devices or solenoid coils.

Note 3: See page 10-1 to confirm the applicable support tool for each control module.

[3] System configuration using network and link modules

3-4 Table of module

[1] JW series modules

Module name	Model name	Outline	Accessories		Appropriate to UL/CSA standard
			Item	Quality	
Control module	JW-50CU	CPU Max. I/O points:512 Program ROM capacity: 7.5K words (standard) Battery-less operation possible using program ROM(at ROM operating).	Battery-less connector Memory protect key	1	○
	JW-50CUH			2	
	JW-70CU	CPU Max. I/O points:1024 Program ROM capacity: 63K words Battery-less operation possible using program ROM(at ROM operating).	Battery-less connector Memory protect key Dsub connector (15- pin male)	1	○
	JW-70CUH			2	
	JW-100CU	CPU Max. I/O points:4096 Program ROM capacity: 63K words Battery-less operation possible using program ROM(at ROM operating).	Ditto	Ditto	○

3-5 General specifications

[1] When AC power is used

Item	Specifications
Power voltage	100 to 120/200 to 240 VAC, 50/60 Hz *Note 1
Supply voltage tolerance	85 to 132 VAC/170 to 264 VAC *Note 1
Voltage interruption detection interval	Available voltage interruption time of 10ms max. *Note 2
Insulation resistance	No less than 10M ohms when measured with a 500 VDC megger (between AC external terminal and rack panel) *Note 3
Dielectrical strength	1500 VAC, 50/60 Hz, 1 minutes (between AC external terminal and rack panel) *Note 3
Noise immunity	1000 Vp-p, 1 μ s (by noise simulator between the power line and rack panel) *Note 4
Storage temperature	-20 to 70 °C *Note 5
Ambient temperature	0 to 55 °C *Note 5
Ambient humidity	35 to 90%RH(non-condensing) *Note 5
Atmosphere	Free from corrosive gas
Vibration resistance	JIS C 0911 or equivalent, vibration with 0.075 mm amplitude (10 to 55Hz), 1G acceleration (55 to 150Hz), and 10 to 150 to 10Hz frequency cycle(8 minutes/cycle) applied along X, Y, and Z directions for 2 hours in each, 15 cycles each
Shock resistance	JIS C 0912 or equivalent (10G, 3 times in each X, Y, and Z directions)
Power consumption	55W or less (when one power supply module is loaded to capacity) *Note 6
Weight	Approx. 9kg (when power supply module, one control module, eight I/O modules, and two option modules installed in basic rack panel)
Grounding	Class-3 grounding

Note 1: Specifications for the power supply module (JW-1PU) installed in this PC basic rack panel.

Note 2: Voltage interruption detection interval is variable with system memory setting. For more details, see the programming manual, 2-4-(5) "Control module function setting area". The default setting is 10ms.

Note 3: Measured across power supply module's AC input terminal and basic rack panel frame holding the JW-1PU power supply module.

Note 4: With the JW-1PU power supply module, control module, option module, and I/O modules installed in the basic rack panel, a noise voltage of 1000 Vp-p, 1 μ s applied from a noise simulator across the power line and rack panel frame, with the system power turned ON.

Note 5: For the storage and operating temperatures for support tools, see the specifications for each tool.

Note 6: Measured with the JW-1PU power supply module installed in the basic rack panel and electrically loaded to capacity.

[2] When DC power is used

Item	Specifications
Power voltage	240 VDC *Note 1
Supply voltage tolerance	20.4 to 32.0 VDC *Note 1
Voltage interruption detection interval	Available voltage interruption time of 10ms max. *Note 2
Insulation resistance	No less than 10M ohms when measured with a 500 VDC megger (between DC external terminal and rack panel) *Note 3
Dielectrical strength	1000 VAC, 1 minutes (between DC external terminal and rack panel) *Note 3
Noise immunity	1000 Vp-p, 1 μ s (by noise simulator between the power line and rack panel) *Note 4
Storage temperature	-20 to 70 °C *Note 5
Ambient temperature	0 to 55 °C *Note 5
Ambient humidity	35 to 90%RH(non-condensing) *Note 5
Atmosphere	Free from corrosive gas
Vibration resistance	JIS C 0911 or equivalent, vibration with 0.075 mm amplitude (10 to 55Hz), 1G acceleration (55 to 150Hz), and 10 to 150 to 10Hz frequency cycle(8 minutes/cycle) applied along X, Y, and Z directions for 2 hours in each, 15 cycles each
Shock resistance	JIS C 0912 or equivalent (10G, 3 times in each X, Y, and Z directions)
Power consumption	37W or less (when one power supply module is loaded to capacity) *Note 6
Weight	Approx. 9kg (when power supply module, one control module, eight I/O modules, and two option modules installed in basic rack panel)
Grounding	Class-3 grounding

Note 1: Specifications for the power supply module (JW-2PU) installed in this PC basic rack panel.

Note 2: Voltage interruption detection interval is variable with system memory setting. For more details, see the programming manual, 2-4-(5) "Control module function setting area". The default setting is 10ms.

Note 3: Measured across power supply module's AC input terminal and basic rack panel frame holding the JW-2PU power supply module.

Note 4: With the JW-2PU power supply module, control module, option module, and I/O modules installed in the basic rack panel, a noise voltage of 1000 Vp-p, 1 μ s applied from a noise simulator across the power line and rack panel frame, with the system power turned ON.

Note 5: For the storage and operating temperatures for support tools, see the specifications for each tool.

Note 6: Measured with the JW-2PU power supply module installed in the basic rack panel and electrically loaded to capacity.

Chapter 4. Name and function of each part

4-1 Combination of each module

Sharp PC are built up using different functional modules, which combine to suit the application. The type of the rack panel required depends on type of the I/O modules (JW-I/O or ZW-I/O) used.

[1] Module configuration using JW-series I/O modules

The JW-series I/O module require the JW-4BU/6BU/8BU/13BU rack panel.

(1) Module configuration when JW-I/O modules is used as a basic rack panel

This example shows a JW-13BU rack panel with a power supply module, a control module, two option modules, and nine I/O modules.

Note 1: The JW-50CU, JW-50CUH control module includes a memory modules as a standard feature.

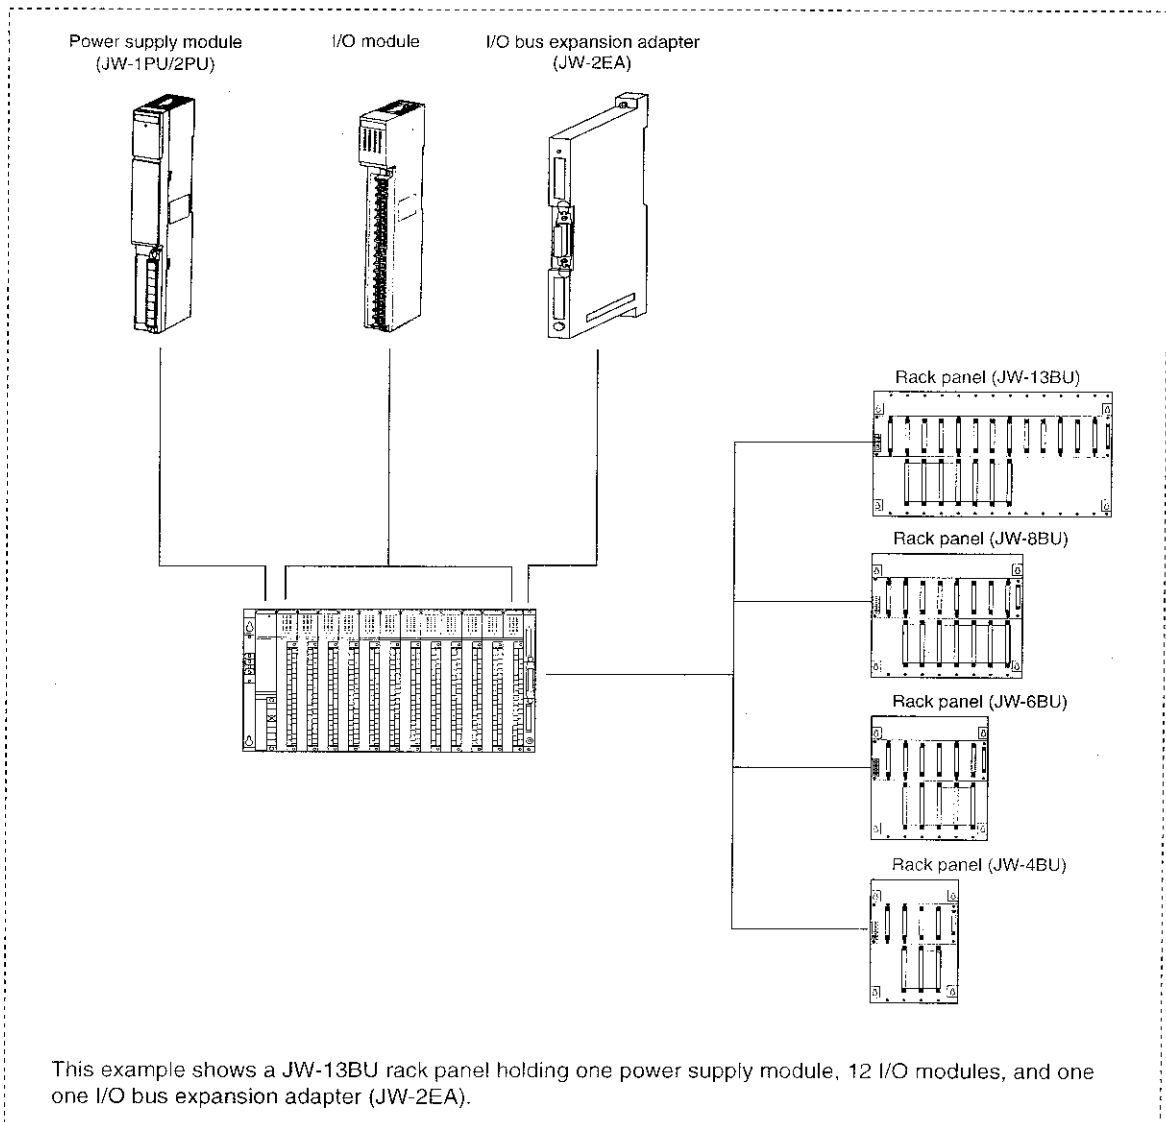

Note 2: The ZW-6CC cable cannot be connected to the JW-6BU rack panel.

The devices within the dotted line make up possible basic rack panel.

Note 3: Refer to page 10-1 to confirm the applicable support tool for each control module.

(2) Module configuration when JW-I/O modules is used as a expansion rack panel

When additional I/O modules are required, use another JW-4BU/6BU/8BU/13BU rack panel, as in the following example.

- Note 1: Be sure to install the power supply module in the left end slot a power supply module in the expansion rack panel is required only if that in the basic rack panel does not have enough marginal power to supply the I/O module in the expansion rack panel.
- Note 2: Install the I/O bus expansion adapter JW-2EA in the right end I/O expansion slot.
- Note 3: I/O modules may be installed in any slot the JW-4BU/6BU/8BU/13BU rack panel. However, that I/O modules can be not installed in a slot to which an option cable (ZW-2CC/4CC/6CC) is connected.

JW-13BU rack panel holding 13 I/O modules.

[2] Module configuration using ZW-series I/O modules

(1) Module configuration when ZW-I/O modules is used as a basic rack panel

The following types of rack panel may be used as a basic rack panel (which hold the control module) for ZW-series I/O modules;

Model name	Installable modules
ZW-28KB	Power supply module, control module, 2 option modules, 8 I/O modules
ZW-46KB	Power supply module, control module, 4 option modules, 6 I/O modules
ZW-04KB	Power supply module, control module, 4 I/O modules *Note 1
ZW-02KB	Power supply module, control module, 2 I/O modules *Note 1
ZW-08BU	Power supply module, control module, 8 I/O modules

Note 1: ZW-04KB and ZW-02KB have no I/O expansion connector.

This example shows a ZW-28KB basic rack panel with a power supply module, a control module, two option modules, and eight I/O modules.

Note 1: The JW-50CU, JW-50CUH control module includes a memory modules as a standard feature.

Note 2: Refer to page 10-1 to confirm the applicable support tool for each control module.

The devices within the dotted line make up possible basic rack panel.

(2) Module configuration when ZW-I/O modules is used as a expansion rack panel

When additional ZW-series I/O modules are required, use any of the following expansion rack panel and module combinations;

Model name	Installable modules
ZW-108ZB	Expansion power supply module, 8 I/O modules
ZW-104ZB	Expansion power supply module, 4 I/O modules
ZW-102ZB	Expansion power supply module, 2 I/O modules
ZW-508ZB	8 I/O modules
ZW-08BU	Power supply module, option module, 8 I/O modules

The devices within the dotted line make up possible basic rack panel.

Note 1: Choose the appropriate expansion power supply module type depending on the power required for the I/O modules used in the expansion rack panel.

To determine the required power, see page 4-73.

Note 2: When the expansion rack panel is to be positioned on the right hand side of the basic rack panel, a ZW-1KC signal cable for expansion (length: 1m) is required.

[3] Choosing procedure in each modules

Choose the modules for JW50/70/100, JW50H/70H/100H in the following sequence:

Choose a power supply module

Choose a power supply module according to the input supply voltage.

Model name	Specifications
JW-1PU	For 100/200 VAC input
JW-2PU	For 24 VDC input

Choose a control module

Choose a control module according to the number of I/O points and program capacity required;

Model name	Max. No. of I/O points	Program memory	File memory
JW-50CU JW-50CUH	512	7.5K words	16K bytes
JW-70CU JW-70CUH	1024	63K words max.	448K bytes max.
JW-100CU JW-100CUH	4096(using JW-I/O) 2048(using ZW-I/O)	63K words max.	448K bytes max.

Choose a memory module

The JW-70CU/100CU, JW-70CUH/100CUH control module functions only if a memory module is installed in it.

Choose a memory module according to the program and file capacities required;

Model name	Program capacity	File capacity
ZW-1MA, ZW-1MAH	7.5K words	16K bytes
ZW-2MA, ZW-2MAH	15.5K words	64K bytes
ZW-3MA, ZW-3MAH	31.5K words	128K bytes
ZW-4MA, ZW-4MAH	63K words	448K bytes

Note 1: The JW-50CU, JW-50CUH control module contains a memory module as a standard feature. No additional memory module can be installed in it.

Choose a I/O module

First choose either the JW and ZW series I/O module type. Only one type can be used in a rack panel. Then choose the specific I/O module model list given in page 3-7, depending on the application.

Once the type of I/O module (either JW or ZW) is selected, program the control module by setting the module's internal DIP switches accordingly (see page 4-11).

Choose a rack panel

Now choose the type of rack panel depending on the types and numbers of the I/O and option modules.

Model name	No. of installable modules	Kinds of I/O module
JW-13BU	13 modules	For JW-I/O
JW-8BU	8 modules	For JW-I/O
JW-6BU	6 modules	For JW-I/O
JW-4BU	4 modules	For JW-I/O
ZW-28KB	2 option, 8 I/O	For ZW-I/O
ZW-46KB	4 option, 6 I/O	For ZW-I/O
ZW-04KB	0 option, 4 I/O	For ZW-I/O
ZW-02KB	0 option, 2 I/O	For ZW-I/O
ZW-08BU	0 option, 8 I/O	For ZW-I/O

To next page

From previous page

Choose an option module

Model name	Remarks
ZW-10CM	Link module
ZW-20CM	Network module
ZW-30CM	Network module
JW-10CM	Link module
JW-20CM	Network module

Choose an option cable

*Note 1
*Note 2

Model name	Remarks
ZW-2CC	For 2 option modules
ZW-4CC	For 4 option modules
ZW-6CC	For 6 option modules

Note 1: Not necessary when no option module is to be used.

Using ZW-I/O

Using JW-I/O

Choose an expansion rack panel

Model name	Remarks
JW-13BU	13 modules (for JW-I/O)
JW-8BU	8 modules (for JW-I/O)
JW-6BU	6 modules (for JW-I/O)
JW-4BU	4 modules (for JW-I/O)

Note 2: The ZW-6CC cable can be used only for the JW-13BU rack panel.

Choose a I/O bus expansion adapter

When the system requires three steps or more rack panels or a power supply module have to be installed on second rack panel, the I/O bus expansion adapter is needed.

Model name	Remarks
JW-1EA	Required in the basic rack panel where the control module is installed.
JW-2EA	Required in each expansion rack panel(one set in each rack panel).

Choose a power supply module

If the total power requirements for the control and expansion rack panels exceed the capacity of the power supply module installed in the basic rack panel, an expansion power supply module is required in the expansion rack panel. To determine the power requirements, see page 4-73.

Choose a power supply module

Choose the cable type or types depending on the distance between rack panels.

The I/O expansion cables include the following 8 modules in two types:

Model name	Specifications	Remarks
JW-05KC	50 cm cable	For rack panel
JW-1KC	1m cable	
JW-05EC	50 cm cable	For JW-1EA/2EA
JW-1EC	1m cable	
JW-3EC	3m cable	
JW-10EC	10m cable	
JW-30EC	30m cable	
JW-50EC	50m cable

From previous page*1

Using ZW-I/O

Choose an expansion rack panel.

Choose one or more expansion rack panels depending on the number of I/O modules required.

Model name	Remarks
ZW-108ZB	Can be installed the one expansion rack panel and eight I/O modules
ZW-104ZB	Can be installed the one expansion rack panel and four I/O modules
ZW-102ZB	Can be installed the one expansion rack panel and two I/O modules
ZW-508ZB	Can be installed the eight modules
ZW-08BU	Can be installed the one expansion rack panel and eight I/O modules

Choose an I/O expansion module (ZW-10EU).

The I/O expansion module is needed for a system requiring 32 or more I/O modules. It is not needed for a system with 32 or less I/O modules.

Choose a expansion power supply module

Choose the appropriate expansion power supply module depending on the overall system power requirements. To determine the power requirements, see page 4-73.

Model name	Remarks
ZW-100PU1	5 VDC, 7A output
ZW-100PU2	5 VDC, 12A output

Choose a expansion signal cable

If the signal cable supplied with the expansion rack panel is too short when using the ZW-08BU expansion rack panel, use the appropriate signal cable for expansion.

Model name	Remarks
ZW-05KC	50cm cable
ZW-1KC	1m cable

Choose a support tool.

Choose a applicable support tool for a control module depending on the application. Refer to page 10-1 for details.

Hand-held programmer
(JW-10PG/11PG/12PG/13PG/14PG)

Multi-purpose programmer
(JW-30G/32PG/40PG/50PG)
The following diagram is JW-50PG)

Programmer
(ZW-101PG1)

Ladder processor II
(Z-100LP2S)

Model name	Remarks
Hand-held programmer (JW-14PG ,etc.)	Program creation, monitor, and change (compatible with JW series)
Multi-purpose programmer(JW-50PG ,etc.)	Program creation, monitor, change, recording, and reloading (compatible with JW series)
Programmer (ZW-101PG1)	Program creation, monitor, and change
Ladder processor II (Z-100LP2S)	Program creation, monitor, change, recording, and reloading

4-2 Control module

[1] Name and function of each part

JW-50CU
JW-50CUH

JW-70CU/100CU
JW-70CUH/100CUH

① RUN indicator (green)

Appearance	Contents
Light ON	Normally operating
Flashing at regular intervals	PC stopping
Flashing intermittently	Live I/O replace mode is selected, or a fuse failure or option module error occurred when uninterrupted operation is specified (in which case fuse failure or an option module error is ignored and operation is continued.)
Light OFF	An error detected during self-diagnosis. (Also comes on in the event of battery error)

② Fault indicator (red)

This light comes on if an error was detected during self test. The PC stops program run.(The PC continues operation in the event of a battery error.)

③ Memory protect switch

Use this switch to write-protect the program and system memories (set to ON). It is useful to prevent inadvertent write access to the memories while monitoring PC operation. When downloading a program from your host system to the PC via an option module(JW-10CM, etc.) or when making any change or correction to the contents of the program or system memory with the support tool , set this switch to OFF.

④ Connector for connecting support tool

Connect a programmer or any other support tool to this connector.

⑤ Rating plate

⑥ Connector for connecting communication port (JW-70CU/100CU, JW-70CUH/100CUH)

Connect a device with serial communication port, such as a personal computer, to this connector. (refer to page 4-103).

⑦ Battery replacement label location

Affix a label indicating the due date of the next battery replacement.Be sure to replace the battery before the date indicated on the label. After replacing the battery, replace the label with a new due date label.

⑧ Battery compartment lid

Remove this lid to gain access to the internal battery.

⑨ Battery module

This battery (DUNT-5784NCZZ) is used to back up the RAM on the memory module.

⑩ Battery connector

This connector normally accepts a battery harness plug to connect the battery to the CPU board. For operation without battery backup, insert a battery-less operation into this connector in place of the battery harness plug.

⑪ Battery-less operation plug

For operation without battery backup, insert this plug into the battery connector  on the CPU board.

⑫ Control module retention screws

Use these screws to secure the control module to the rack panel frame.

⑬ Memory protect key

The ON position of this key switch write-protects the contains of internal memories. The key can be removed only if set at the ON position.

⑭ Module name

- JW-50CU: Control module for the JW50
- JW-70CU: Control module for the JW70
- JW-100CU: Control module for the JW100
- JW-50CUH: Control module for the JW50H
- JW-70CUH: Control module for the JW70H
- JW-100CUH: Control module for the JW100H

⑮ DIP switch

For the details of DIP switch setting, see page 4-11.

[2] Memory protect switch

The memory protect key switch is used to write-protect the program and system memories within the control module.*Note 1

ON position: Write protect

OFF position: Write enable

Key position	JW-10/11/12/ 13/14PG mode	System memory/ program memory write	EEPROM write	File memory write	Auto I/O registration
ON	Monitor	×	×	○	×
	Change				
	Program				
OFF	Monitor	×	×	○	○
	Change	×	○		
	Program	○	○		

× : Write protected ○ : Write enabled

Note 1: The memory protect switch key can be removed from the sky hole only if it is set the ON position. Do not lose it.

Note 2: The mode of JW-50CUH/70CUH/100CUH can not be changed when the memory protect switch is ON. Turn ON the memory protect switch during the PC operation to protect the PC stop causing from the mis-operation.

[3] DIP switch

DIP switches SW2-1 and SW2-2 are found on the CPU board in the control module. Set them to match the application of the PC.

- For the JW-50CU/70CU/100CU

- For the JW-50CUH/70CUH/100CUH

Switch setting table

	ZW-I/O		JW-I/O
	All OFF	Output hold	Output hold
SW2-1	OFF	ON	ON
SW2-2	OFF	OFF	ON

Switch setting table

	ZW-I/O		JW-I/O
	All OFF	Output hold	Output hold
SW2-1	OFF	OFF*	ON
SW2-2	OFF	ON*	ON

*: Difference with JW-50CU/70CU/100CU

(1) Description of switch settings

① Output hold and all points OFF selection

Selects the operating state of the output circuit when the CPU halts.

(Set the switches according to the type of control module.)

Control module	JW-50CU/70CU/100CU	JW-50CUH/70CUH/100CUH
Switch	SW2-1	SW2-2

Switch setting	Description
ON	Output hold Retains the address area set in system memory #0232 and #0233.
OFF	All points OFF

• Factory setting at delivery : ON

Note: Be sure to set the switch to ON (output hold) when using the JW-I/O module.

② I/O module type selection

Selects the type of I/O module used with the PC.

(Set the switches according to the type of control module.)

Control module	JW-50CU/70CU/100CU	JW-50CUH/70CUH/100CUH
Switch	SW2-2	SW2-1

Switch setting	Description
ON	JW-I/O module in use
OFF	ZW-I/O module in use

• Factory setting at delivery : ON

(2) Monitoring the switch settings

The switch settings are stored in system memory #0042 and can be monitored using a support tool such as the support tool.

- : ON(indicates switch is ON)
- : OFF(indicates switch is OFF)

Refer to the instruction manual of each support tool for the monitoring procedure.

[4] Outline dimensions drawings

Note 1: These dimensions refer to the front edge of the rack panel.

Note 2: The drawings above are for the JW-70CU/100CU and JW-70CUH/100CUH control modules.

[5] Performance specifications

		JW-50CU/70CU/100CU	JW-50CUH/70CUH/100CUH
Program method		Stored program method	
Control method		Cyclic operation method and interrupt processing method	
Processing speed	Basic instructions (except for the TMR, CNT, MD, and application instructions)	0.38 μ s/instruction	0.25 μ s/instruction*Note 2
	Application instructions, TMR, CNT, and MD instruction	Average a few microseconds/instruction (Note 1, 2) (JW-50CUH/70CUH/100CUH process approximately 1.5 times as fast as JW50H/70H/100H.)	
Instruction type	Basic instructions	20 kinds	
	Application instructions	116 kinds	157 kinds
Program memory capacity	RAM	JW-50CU, JW-50CUH: 7.5K words max. (standard installed) JW-70CU/100CU, JW-70CUH/100CUH: 7.5K to 63K words (optional)	
	EPROM	JW-50CU, JW-50CUH: 7.5K words max. (27C512 \times 1) JW-70CU/100CU, JW-70CUH/100CUH: 31.5K words max. (27C512 \times 1)	
	EEPROM	JW-50CU, JW-50CUH: 7.5K words max. (28C256 \times 1) JW-70CU/100CU, JW-70CUH/100CUH: 15.5K words max. (28C256 \times 1)	
Memory backup		Internal lithium battery (DUNT-5784NCZZ) backs up RAM contents. Operation on ROM without battery backup is possible by setting address #0225 of the system memory.	
I/O control method	For JW-I/Os	Batch refresh method and refresh method by instruction	
	For ZW-I/Os	Batch refresh and method	
No. of control I/O points	JW-I/Os	No. of I/O points	JW-50CU, JW-50CUH: 512 points max. JW-70CU, JW-70CUH: 1024 points max. JW-100CU, JW-100CUH: 4096 points max.
		No. of modules	8 rack panels max.
	ZW-I/Os	No. of I/O points	JW-50CU, JW-50CUH: 512 points max. JW-70CU, JW-70CUH: 1024 points max. JW-100CU, JW-100CUH: 2048 points max.

Note 1: For the execution speed of each instruction, refer to the "Instruction list" in the programming manual.

Note 2: The processing speed of JW50H/70H/100H can be set for the same speed as JW50/70/100 by setting the memory module switch.(See page 4-20).

		JW-50CU/70CU/100CU	JW-50CUH/70CUH/100CUH	
Data memory	I/O relays	2048 points(00000 to 03777)	The latched relay area can be expanded or reduced in an 8-point increment by setting the system memory addresses #0230 and #0231 (to allow the last output status to be held at power failure.)	
	Auxiliary relay	1536 points (04000 to 06777)		
	Latched relay	224 points (07000 to 07337) (addresses 07300 to 07337 are used for the ZW/JW-10CM link module). 256 points (04000 to 07777)		
	Special relay	32 points (07340 to 07377) Non-carry flag (07354) Error flag (07355) Carry flag (07356) Zero flag (07357) 0.1 sec.clock (07360) Initialize pulse (07362) Output module fuse blown (07362) *Note 2 1.0 sec. clock (07364) DIP switch (07365) Normally OFF contacts (07336) Zero-cross switch (07367) Memory error (07370) CPU error (07371) Battery error (07372) I/O error (07373) Option error (07374) Special I/O module error (07375) *Note 2 Expansion power supply error (07376) *Note 3 Power supply error (07377) Error code stored (07340 to 07347)		
	General-purpose relay	3072 points (10000 to 15777) used as link relay etc. (latched relay available)		
	TMR/CNT time limit contacts	512 points (T or C000 to C777)	1024 points (T or C0000 to C0777, T or C1000 to C1777)	
	TMR/CNT/MD		Total of 512 points (000 to 777) Timer number: 100 ms timer (TMR000 to 777) 10 ms timer (TMR700 to 777)	Total of 1024 points (0000 to 1777) *Note 4 Timer number: 100 ms timer (TMR0000 to 1777) 10 ms timer (TMR0400 to 0777) The setting value of a timer, counter and MD can be specified in a register. *Note 5
			Timer setting time: 100 ms timer; 0.1 to 3276.7 sec. (BIN) ; 0.1 to 799.9 sec. (BCD) 10 ms timer; 0.01 to 19.99 sec. (BCD) Counter setting value: 1 to 32767 (BIN), 1 to 7999 (BCD) MD setting value: 0 to 999 The current values of the counter and MD are retained on power failure. The current timer data can be either reset or retained on power failure at user's choice. Timer function is user-selectable in 10ms increments.	
Registers	5120 bytes (backup at battery failure) 09000 to 09777, 49000 to 49777, 89000 to 89777 19000 to 19777, 59000 to 59777, 99000 to 99777 29000 to 29777, 69000 to 69777 39000 to 39777, 79000 to 79777			

Note 1: The maximum number of control I/O points differs from one model to another. The remaining I/O relay area can be used for auxiliary relays.

JW-50CU, JW-50CUH: 01000 to 03777

JW-70CU, JW-70CUH: 02000 to 03777

If more than 2048 I/Os are required, convert the auxiliary, latch, and general purpose relays into I/O relays.

Note 2: Available only for JW-series I/Os.

Note 3: Available only if the I/O bus expansion adapter is used.

Note 4: System memory #0201 can be used to set the number of contacts either 512 or 1024. If 1024 points are set, T or C1000 to C1777 are shared with general purpose relays 13000 to 14777.

Note 5: See the description of application instructions F-260, Fc260, F-261 and Fc261 in the programming manual.

Note 3: When an error occurs, the real-time clock is reset to 24-hour representation.																																																																																		

Note 1: In a control module with no battery, the real-time clock start with 00H: 00M: 00S, 00 year 00 month 00 day at power ON.

Note 2: The address range E0000 to E1577 is assigned as an error history storage area of variable size that depends on the number of installed option modules. The areas assigned to uninstalled option module are available as general-purpose registers.

JW-50CU/70CU/100CU, JW-50CUH/70CUH/100CUH		
	Address	Function
System memory	#0010 to #0017	Clock feature
	#0020	User program EEPROM area
	#0030	Minimum scan time monitor (lower BCD digit)
	#0031	Minimum scan time monitor (upper BCD digit)
	#0032	Current scan time monitor (lower BCD digit)
	#0033	Current scan time monitor (upper BCD digit)
	#0034	Maximum scan time monitor (lower BCD digit)
	#0035	Maximum scan time monitor (upper BCD digit)
	#0036	Last I/O address monitor ^(OCT)
	#0042	ID code monitor of the installed memory module
	#0046	I/O address monitor where an error was detected ^(OCT)
	#0050	Error slot number monitor
	#0052	Error address monitor on user program (lower octal digit)
	#0053	Error address monitor on user program (upper octal digit)
	#0054	Error address monitor on user program (file number)
	#0160 to #0167	Error codes obtained from self diagnosis
	#0170 to #0177	Option error codes
	#0201	Specifies the TMR reset condition
	#0202	Specifies the CNT reset condition
	#0204	Specifies the program memory capacity
	#0205	Specifies file register capacity (file No.1)
	#0206	Specifies continue/stop operation upon detection of a fuse failure
	#0207	Specifies continue/stop operation upon detection of an option error
	#0210 to #0222	ZW-10CM, JW-10CM: Area used by a remote I/O master station manual allocation
	#0223	Selects clock functions
	#0224, #0225	Specifies the use of comment memory
	#0226	Specifies scan time
	#0227	Selects 10ms timer functions
	#0230	Sets latched relay area (lower octal digit)
	#0231	Sets latched relay area (upper octal digit)
	#0232	Specifies the output holding address (lower octal digit)
	#0233	Specifies the output holding address (upper octal digit)
	#0236, #0237	Sets the commination port's mode
	#0241 to #0243	Sets interrupt inputs (JW)
	#0244	Enables/disables data write into file memories (files 1 to 7)
	#0246	Extends voltage interruption detction interval
	#0247	Selects either automatic or manual registration of I/O addresses.
	#0250	Specifies the total number of bytes used by I/O modules (ZW)
	#0252	Specifies the I/O address self-test feature (ZW)
	#0255	Specifies battery-less operation
#0256	Selects ROM type	
#0260 to #0377	Specifies parameters for the ZW-10CM, JW-10CM data link master station	

Note 1: The JW and ZW given in parentheses denote the functions and for the JW-I/Os and ZW-I/Os respectively.

		JW-50CU/70CU/100CU, JW-50CUH/70CUH/100CUH
System memory	Address	Function
	#0660 to #0757	The number of dummy I/Os
	#0760 to #0777	The first address of each rack panel
	#1200 to #1376	The first address of special I/O modules.
		#0660 to #1377 can be assigned with auto I/O registration or manual I/O registration using a support tool (JW-14PG, etc.) It is impossible to register directly to system memory #0660 to #1377.
Comment memory	JW-50CU, JW-50CUH: The registers for file number 1 can be used for comment memory. (16 kbytes maximum)	
	JW-70CU/100CU, JW-70CUH/100CUH: The registers for file numbers 1 to 7 and C to E can be used for comment memory. (Note 1)	
	JW-50CU, JW-50CUH: None	
	JW-70CU/100CU, JW-70CUH/100CUH: Built-in Communication interface standard: RS-485, RS-232C Transfer speed: 9600, 4800, 2400, 1200, 600 bps Data length: 7 bits Parity bit: odd, even, none Stop bit: 1 or 2 bits Connection configuration: 1:1 (RS-232C), 1:N(RS-485) Data format: Subset of computer link format Connector: Dsub-15P	
Interrupt program		Input interrupt: 16 levels (LB1360 to LC1377) Timer interrupt: 1, 2, 5, 10, or 20ms interval (LB1353 to LB1357) The input and timer interrupts can be enabled or disabled independently. The labels for disabled interrupts may be used as common labels.
Debug function	Sampling trace	Data for (16 relay points + 6 bytes register)×256 times or 16 relay points×1024 times can be traced at an arbitrary period (50ms units) at every scan to 1 second (up to 64 kbytes of data can be traced when a file register is used for trace memory).
	Break function	Any program address or data memory address can be set as a breakpoint. (Continuation or break of the operation can be selected when a break condition is met.)
	Step operation	Executes the program, one circuit at a time.
	N scan operation	Executes operations for the specified number of scans (1 to 9999 scans)
	Forced ON-OFF of I/O relay	Turns an I/O relay ON or OFF regardless of the input signal or operation result (maximum of 32 points each for ON and OFF)

Note 1: The memory module installed in the control module determines the files that can be used.

Memory module	File register which can be used as comment memory		
	File number	Address	Maximum capacity
ZW-1MA, JW-1MAH	File 1	00000 to 03777	16 kbytes
ZW-2MA, JW-2MAH	File 1	00000 to 17777	64 kbytes
ZW-3MA, JW-3MAH	File 1 and 2	00000 to 17777 for each	128 kbytes
ZW-4MA	Files 1 to 7 Files C to E	00000 to 17777 for each	448 kbytes Files 4 to 6 and C to E are switched for use (see page 5-7)
JW-4MAH			576 k bytes Files 6 and E are switched for use (see page 5-10)

JW-50CU/70CU/100CU, JW-50CUH/70CUH/100CUH																
Item	Contents	PC operation status	Halt output	Control module indicators		Power supply module indicator	Special relay	Error code *Note 1

		Option bus error							Stop	Open	OFF					ON
Battery error	Battery voltage drop	Operation							Close	ON	ON	07372	20	22	8	
Halt output		Triac output, 100/200 VAC, 0.5A Turned ON (closed) when the PC is running. (Note 3)														

Note 4

Note 4

Note 1: All error codes are in BCD.

Note 2: The upper or lower state of each item may occur when the fuse is melted down in the system memory #0206 or #0207, or by the setting in the case of option abnormality.

(Setting)	(State)
Continue operation	⇨ Upper column
Halt output	⇨ Lower column

Note 3: When the JW-1PU power supply module is used. If the JW-2PU power supply module is used, a transistor output with 24 VDC, 0.5 A rating is used.

Note 4: Valid only for JW-series I/O modules.

Note 5: If the system detects an error in the optional bus, it stops operation by turning ON the normally OFF contact point 07366. In the case of turning ON 07366 with the user's program or that 07366 is ON without clearing the data memory when putting the power in the PC for the first time, error code 52 may be shown.

4-3 Memory module

The memory module is used for program creation and storage. The relationship between the control module and memory module is given below.

Control module	Memory module
JW-50CU, JW-50CUH	Installed as a standard module (use of any other memory modules ZW-1MA/JW-1MA are not allowed)
JW-70CU/100CU JW-70CUH/100CUH	Module not installed (install the memory module as described below)

[1] Memory module selection

Select a memory module according to the program capacity and processing speed of the control module.

(1) Processing speed of the control module

The relationship between the four installation configurations ① to ④ shown above and the processing speed of the control module is described below. In installation configuration ①, select conventional or high speed operation using the switch on the memory module. (See pages 5-8 to 5-10). Conventional speed refers to the same processing speed that is available on the JW50/70/100.

Installation configuration	Processing speed of the control module		
		Basic instructions (except TMR, CNT and MD)	TMR, CNT and MD application instructions
①	High speed operation	0.25 μ s/instruction	Average μ s/instruction · Processing speed during high speed operation is approximately 1.5 times that of conventional speed operation.
	Conventional speed operation	0.38 μ s/instruction	
②, ③, ④	Conventional speed operation		

- For the processing speed of each instruction, refer to the "Description of instructions" in the programming manual.

(2) Program memory, file memory

Memory module Model name	Program memory		File memory		
	Capacity	Address	Capacity	Address	File in use
ZW-1MA, JW-1MAH	7.5 K words	00000 to 16777	7.5 K words	00000 to 37777	File 1
ZW-2MA, JW-2MAH	15.5 K words	00000 to 36777	15.5 K words	00000 to 17777	File 1
ZW-3MA, JW-3MAH	31.5 K words	00000 to 76777	31.5 K words	00000 to 17777	File 1,2
ZW-4MA, JW-4MAH	63 K words	00000 to 76777	63 K words	00000 to 17777	File 1 to 7

• Address map of each memory module

ZW-1MA, JW-1MAH		ZW-2MA, JW-2MAH		ZW-3MA, JW-3MAH		
Program memory (7.5 K words)	File register (16 K words) [File 1]	Program memory (15.5 K words)	File register (64 K words) [File 1]	Program memory (31.5 K words)	File register (64 K words) [File 1]	File register (64 K words) [File 2]
00000 to 16777	000000 to 037777	00000 to 36777	000000 to 177777	00000 to 76777	000000 to 177777	000000 to 177777

ZW-4MA, JW-4MAH								
Program memory (31.5 K words) [File 8]	File register (31.5K words) [File 9]	File register (64 K words) [File 1]	File register (64 K words) [File 2]	File register (64 K words) [File 3]	File register (64 K words) [File 4]	File register (64 K words) [File 5]	File register (64 K words) [File 6]	File register (64 K words) [File 7]
00000 to 76777	00000 to 76777	000000 to 177777	000000 to 177777	000000 to 177777	000000 to 177777	000000 to 177777	000000 to 177777	000000 to 177777

• Refer to page 4-18 for comment memory.

[2] Name and function of each part

- ① ROM/RAM selector switch
If you installed an EPROM or EEPROM chip in the ROM socket, set this switch to ROM. Otherwise set it to RAM (see page 5-6, 5-8, and 5-9.)
- ② EPROM/EEPROM selector switch
Set this switch to the appropriate position depending on the type of the ROM chip installed in the ROM socket. If no ROM is installed, it may be set to any position.
- ③ Super capacitor
The RAM backup capacitor retains the RAM contents for approximately 10 minutes after the memory module is removed from the CPU board.
- ④ ROM socket
This socket accepts an EPROM or EEPROM chip.
- ⑤ RAM
These RAM chips are used as program memory.
- ⑥ Module name
Contains the model name of the memory module.
- ⑦ DIP switch
Set this switch depending on the application purposes of files. (see page 5-7, 5-10).
- ⑧ Normal/high speed switch
Set processing speed of control module.(see page 5-8 to 5-10).

[3] How to use

(1) Registration of memory capacity

Store the capacity of the program memory and the capacity of the file 1 register into the system memory according to the installed memory module.

Program memory capacity		
System memory #0204 (set in octal)	200	7.5 Kwords
	201	15.5 Kwords
	202	23.5 Kwords
	203	31.5 Kwords
	207	63 Kwords

Register capacity of file 1		
System memory #0205 (set in octal)	000	—
	001	16 Kwords
	002	32 Kwords
	003	48 Kwords
	004	64 Kwords

Note 1: The file register capacity setting is unrelated to whether the file is used or not. The setting is used when transferring files with ladder processor II(Z-100LP2S).

(2) ROM operation

ROM operation can be executed by installing an EPROM or EEPROM into the IC socket on the memory module (ZW-1MA/2MA/3MA, JW-1MAH/2MAH/3MAH). To use a PROM or EEPROM, set the area to be ROMed to system memory #0256.*Note 2

See page 7-1 to 7-11.

*Except for B version is not used.

	Setting value		Contents to be ROMed				ROM type	ROM model name
	Octal	Hexa-decimal	System memory	User program	Register	File 1		
System memory #0256	000 ⁽⁸⁾	00 ^(H)	-	-	-	-	-	-
	146 ⁽⁸⁾	66 ^(H)	#0200 to #2177	3.5 Kwords	-	-	EEPROM	AT28C64B-15PC (ATMEL)*
	167 ⁽⁸⁾	77 ^(H)	#0200 to #2177	31.5 Kwords	-	-	EPROM	27C512 (Fujitsu)
	200 ⁽⁸⁾	80 ^(H)	#0200 to #2177	15.5 Kwords	-	-	EPROM	AT28C256-15PC (ATMEL)
	201 ⁽⁸⁾	81 ^(H)	#0200 to #2177	7.5 Kwords	09000 to 09777 19000 to 19777	-	EEPROM	AT28C256-15PC (ATMEL)
	202 ⁽⁸⁾	82 ^(H)	#0200 to #2177	7.5 Kwords	-	16 kbytes		
	203 ⁽⁸⁾	83 ^(H)	#0200 to #2177	-	09000 to 09777 19000 to 19777	-		
	204 ⁽⁸⁾	84 ^(H)	#0200 to #2177	-	-	31 kbytes		

*Note 3

Note 2: ROM operation is not available when memory module ZW-4MA or JW-4MAH is used.

Note 3: If the memory module is removed from the CPU board, place it on an insulating material or into its storage bag to prevent its circuits from shorting.

[4] Using the 63K-word program memory (ZW-4MA, JW-4MAH)

The JW70/100, JW70H/100H with a ZW-4MA, JW-4MAH memory module allows you to create a user program of up to 63K words in size. The program is stored in files No.8 and No.9, 31.5K words in each.

Preparation of program

- An END instruction is placed at the end of both files. If a program written into file 8 is too big, place a jump instruction (F-141, F-151) before the END instruction in file No. 8 to indicate that the program continues in file 9. Otherwise operation will terminate at the end of file No.9 left unexecuted.

[Programming example using a jump instruction]

Note 1: Inserting or deleting program lines will not cause the subsequent lines of the program to be moved from one file to the other. If it is expected that program lines will be inserted in the future, leave space for insertion in the last portion of file No.8.

4-4 Rack panel

[1] Rack panel type description

Rack panels for the JW50/70/100, JW50H/70H/100H PC include 13 models in three types. Choose one or more depending on the types of I/O and power supply modules you use.

I/O module type	Module name	Model name	Outline
JW-I/O	Rack panel	JW-4BU	4 slots for control, power supply, option, and I/O modules.
		JW-6BU	6 slots for control, power supply, option, and I/O modules.
		JW-8BU	8 slots for control, power supply, option, and I/O modules.
		JW-13BU	13 slots for control, power supply, option, and I/O modules.
ZW-I/O	Basic rack panel	ZW-08BU	8 slots for control, power supply, and I/O modules.
		ZW-28KB	12 slots for a control module, a power supply modules, up to two option modules, and up to 8 I/O modules.
		ZW-46KB	12 slots for a control module, a power supply modules, up to two option modules, and up to 6 I/O modules.
		ZW-04KB	6 slots for a control module, a power supply modules, up to two option modules, and up to 4 I/O modules.
	Expansion rack panel	ZW-02KB	4 slots for a control module, a power supply modules, up to two option modules, and up to 2 I/O modules.
		ZW-108ZB	9 slots for an expansion power supply module and up to 8 I/O modules.
		ZW-104ZB	5 slots for an expansion power supply module and up to 8 I/O modules.
		ZW-102ZB	3 slots for an expansion power supply module and up to 2 I/O modules.
		ZW-508ZB	8 slots for up to 8 I/O modules.

Rack panel: May be used as either a basic rack panel or an expansion rack panel. Use a JW-1PU or JW-2PU for the power supply module. Note that no option module can be installed in the ZW-08BU rack panel.

Basic rack panel: Accepts control, power supply, option, and I/O modules.

Expansion rack panel: Accepts an expansion power supply module and ZW-100PU2 for the expansion power supply module can be installed in the ZW-508ZB expansion rack panel.

[2] Name and function of each part

(1) Rack panel

Rack panel (JW-4BU)
(for JW-I/Os)

Rack panel (JW-8BU)
(for JW-I/Os)

Rack panel (JW-13BU)
(for JW-I/Os)

Rack panel (ZW-08BU)
(for JW-I/Os)

(2) Basic rack panel

Basic rack panel (ZW-28KB)
(for ZW-I/Os)

Basic rack panel (ZW-04KB)
(for ZW-I/Os)

(3) Expansion rack panel

Expansion rack panel (ZW-108ZB)
(for ZW-I/Os)

Expansion rack panel (ZW-508ZB)
(for ZW-I/Os)

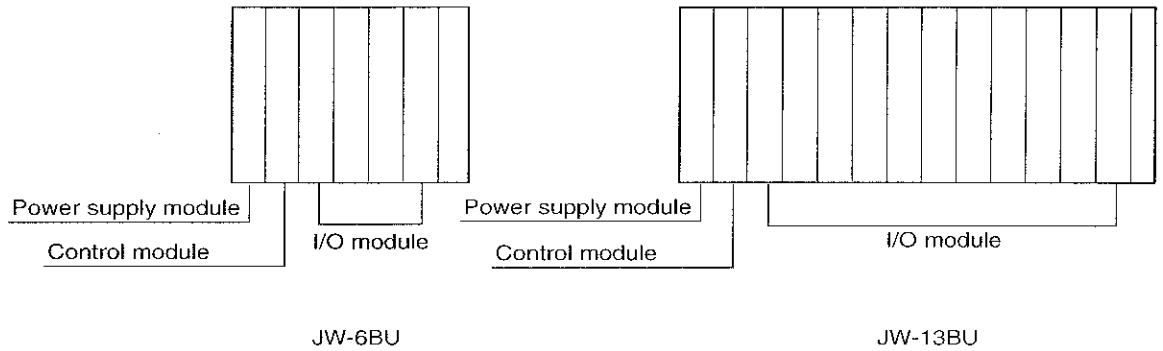

- ① Rack mounting holes
Use these holes and M5 screws for mounting the rack panel on the cabinet.
- ② I/O expansion connector
Use this connector to establish signal and bus connections between the basic and expansion rack panels. Connectors on rack panel and basic rack panel are provided with connector covers.
- ③ Card-edge connector receptacles
Plug the expansion power supply module's or I/O module's card-edge connectors into these receptacles. The basic rack panel have receptacles for up to 8 (ZW-28KB) or 6 (ZW-46KB) I/O modules; the expansion rack panel (ZW-108ZB) has receptacles for one expansion power supply module and up to 8 I/O modules.
These receptacles are provided with covers. For I/O slots holding no I/O modules, leave the covers installed on receptacles.
- ④ Option cable (optional)
This cable is used to connect an option module to the control module.
- ⑤ I/O module mounting guide hole
This hold receives an I/O module's mounting guide pin.
- ⑥ Module retention screw holes
Use these holes to secure the control, I/O, and/or expansion power supply modules to the rack panel frame.
- ⑦ 24 VDC terminal block
Use this terminal block to supply a 24 VDC(or 12 VDC) power from an external source to the DC-type output module (ZW-16S2) installed in the rack panel.
- ⑧ 5 VDC terminal block (on expansion rack panel only)
Use this terminal block to supply a 5 VDC power from the basic rack panel (power supply module) to the expansion rack panel. For connection, be sure to use the 5 VDC cable supplied with the expansion rack panel.
- ⑨ Expansion power supply module mounting guide hole
This hole receives the expansion power supply module's mounting guide claw.
- ⑩ Power indicator
Come on when 5 VDC power is supplied to the expansion rack panel (ZW-108ZB).
- ⑪ I/O expansion connector (IN)
Use this connector to connect the expansion rack panel from the basic rack panel, or from the preceding expansion rack panel (ZW-108ZB) in a daisy-chain configuration.
- ⑫ I/O expansion connector (OUT)
Use this connector to connect the expansion rack panel to the succeeding expansion rack panel in a daisy-chain configuration.
- ⑬ Slot for power supply module
Install the JW-1PU or JW-2PU power supply module into this slot.
- ⑭ Slot for control module
Install the control module into this slot.
- ⑮ Option cable port
This pot receives the ZW-6CC/4CC/2CC option cable.
- ⑯ Module connectors
Plug I/O modules into these receptacles. When these receptacles are to be left unused, leave the connector covers in place.

[3] Description of rack panel (JW-4BU/6BU/8BU/13BU)

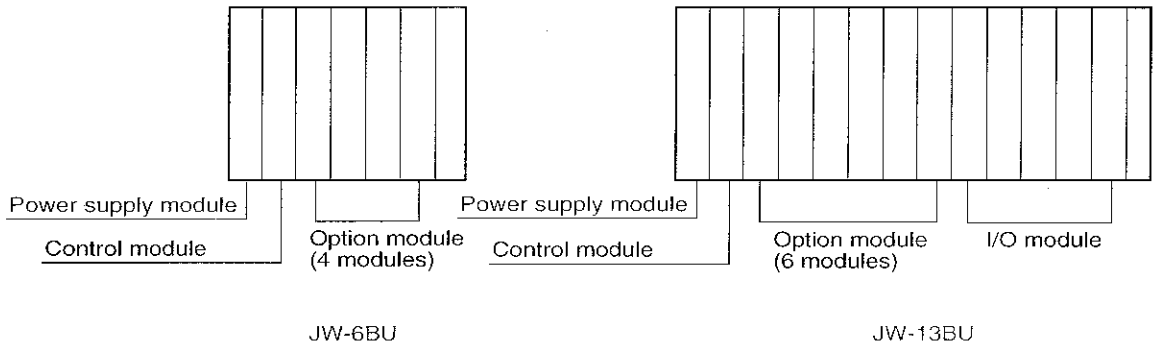

The JW-4BU, JW-6BU, JW-8BU and JW-13BU rack panels are primarily designed to hold JW-series I/O modules. They may be used as either basic rack panels or expansion rack panels.

Model name	Module capacity	Outline
JW-4BU	4	Control module
JW-6BU	6	Power supply module
JW-8BU	8	Option module
JW-13BU	13	JW-series I/O modules

(1) Installing power supply, control, and I/O modules

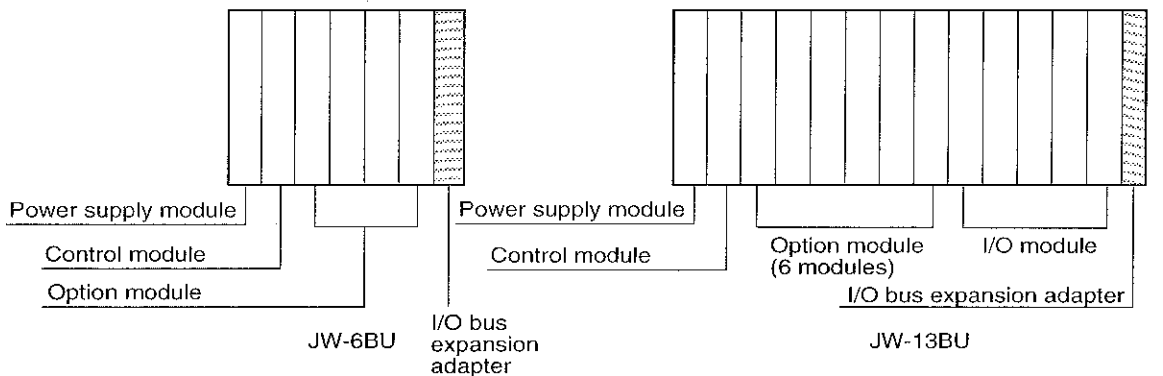

(2) Installing power supply, control, option, and I/O modules

Note 1: Using option modules in the rack panel requires the ZW-2CC/4CC/6CC option cable (optional).

(3) Using the JW-1EA/2EA I/O bus extension adapter

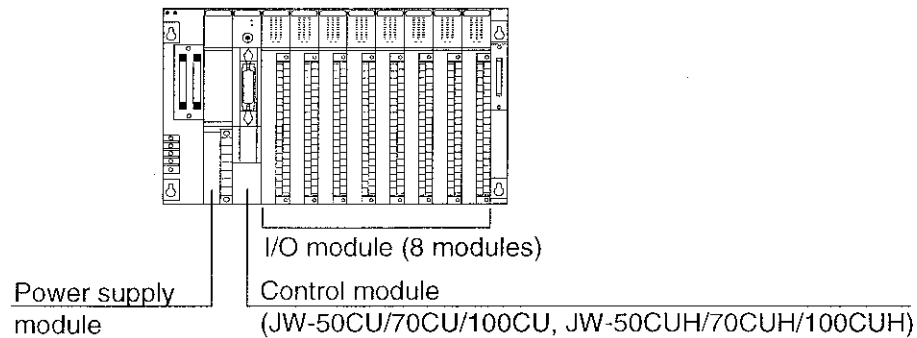

Note 2: Install the I/O bus expansion adapter (JW-1EA/2EA) directly into the I/O expansion connector on the right end of the rack panel.

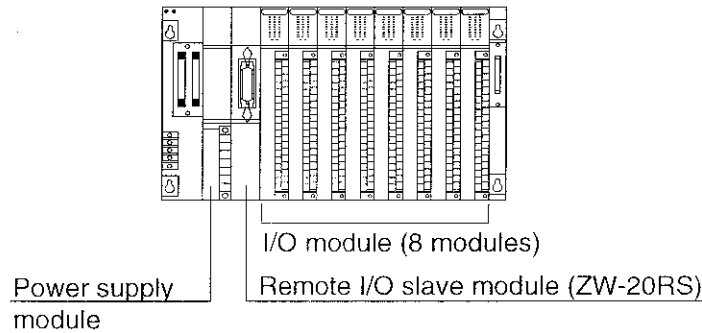

[4] Description of rack panel (ZW-08BU)

The ZW-08BU rack panel is primarily designed to hold ZW-series I/O modules. It may be used as either a basic rack panel or an expansion rack panel.

(1) Using only the control module

(2) Using as a remote I/O slave module

(3) Using as an expansion rack panel *Note 1

The ZW-08BU rack panel may be used as an expansion rack panel if a power supply module is installed in it.

Note 1: When using the rack panel to hold the I/O bus expansion adapter (ZW-10EU), see page 109.

Note 2: When using the rack panel to hold a remote I/O slave module or I/O bus expansion adapter (ZW-10EU), read the instruction manual for the corresponding module or adapter as well.

[5] Notes on the usage of rack panels

(1) Using JW-series I/O modules

1. Using the I/O bus expansion adapter (JW-1EA/2EA) in each rack panel allows up to eight rack panels to be connected in a daisy chain configuration. However, the number of usable I/O modules depends on the number of I/O points controllable by the control module installed in the rack panel. The following table lists the number of usable I/O modules for the various control module types:

	JW-50CU JW-50CUH	JW-70CU JW-70CUH	JW-100CU JW-100CUH
Max. No. of rack panels	8	8	8
I/O points and I/O modules supported using only 64-point I/O modules	512 points/ 8 modules	1024 points/ 16 modules	4096 points/ 64 modules
I/O points and I/O modules supported using only 32-point I/O modules	512 points/ 16 modules	1024 points/ 32 modules	3168 points/ 99 modules *Note 1
I/O points and I/O modules supported using only 16-point I/O modules			1584 points/ 99 modules *Note 1
I/O points supported using X 64-point, Y 32-point, and Z 16-point I/O modules	$64X + 32Y + 16Z \leq 512$ points	$64X + 32Y + 16Z \leq 1024$ points	$64X + 32Y + 16Z \leq 1024$ points

Note 1: These numbers are attained using eight JW-13BU rack panels, one control module, and four power supply modules.

2. If two rack panels are used with no power supply module installed in the second rack panel, only an I/O expansion cable may be used to connect the two rack panels (no I/O bus expansion adapter required). Use a JW-1KC(1m) or JW-05KC (50 cm cable). Do not use a cable 1m or more in length.

(2) Using ZW-series I/O modules

1. A basic rack panel combined with expansion rack panels can hold a total of up to 32 ZW-series I/O modules. However, the number of usable I/O modules depends on the number of I/O points controllable by the control module installed in the rack panel. The following table lists the number of usable I/O modules for the various control module type:

	JW-50CU JW-50CUH	JW-70CU JW-70CUH	JW-100CU JW-100CUH
Max. No. of I/O modules	32	32	32
I/O points and I/O modules supported using only 64-point I/O modules	512 points/ 8 modules	1024 points/ 16 modules	2048 points/ 32 modules
I/O points and I/O modules supported using only 32-point I/O modules	512 points/ 32 modules	1024 points/ 32 modules	512 points/ 32 modules *Note 1
I/O points and I/O modules supported using only 16-point I/O modules	512 points/ 32 modules *Note 1	512 points/ 32 modules	512 points/ 32 modules *Note 1
I/O points supported using X 64-point, Y 32-point, and Z 16-point I/O modules	$64X + 32Y + 16Z \leq 512$ points	$64X + 32Y + 16Z \leq 1024$ points	$64X + 32Y + 16Z \leq 2048$ points

Note 1: If more than 512 I/O points are required with 8 or 16 point modules, see page 101.

2. Up to three expansion rack panels may be attached to the basic rack panel's I/O expansion connector in a daisy chain. If more than three expansion rack panels are needed, see page 4-84.
3. When two or more expansion rack panels are to be used, use an expansion power supply module (ZW-100PU1/100PU2) in one of them, depending on the total system power requirement and the current capacity of the power supply module used in the rack panel.

Note: The I/O expansion cables should not exceed 4m in total length.

4. For connection between the basic and expansion rack panels or among more than one expansion rack panels, use the I/O expansion cable and 5 VDC power cable supplied with each expansion rack panel.
5. Install I/O modules in the slots of the basic or expansion rack panels from left to right, leaving no vacant slot will be inoperative. If you need an intermediate vacant slot for future system expansion, install a dummy module (ZW-100DM).

6. After powering up the system, verify that the power indicator on each expansion rack panel comes on. If a light remains OFF, no 5 VDC power is being supplied to the rack panel. Check the power connection. Note, however, that the ZW-508ZB expansion rack panel has no power indicator.
7. For details on module installation and cabling see Chapter 5 (page 5-1), "Installation" and Chapter 6 (page 6-1), "Wiring."

4-5 Input/output modules

[1] Name and function of each part

(1) JW-series I/O modules

(The diagram is JW-32S)

(Display)

① Retention screw

Use this screw to secure the module to the rack panel frame.

② Ratings plate

③ I/O terminal block (I/O module with 16 I/O points has a single row terminal block).

Use this terminal block to connect I/O cable wires from I/O devices. Since it is detachable from the I/O module housing, you can replace the module without having to disconnect the cable wires from the terminal block.

④ Module connector

Plug this connector into the mating receptacle on the rack panel.

⑤ I/O signal indicators (red LED)

These indicator comes on when the input or output signal on the corresponding channel is turned ON.

Note 1: At power ON, the input signal indicators on input modules and the FUSE indicator on output modules come on momentarily (approx. 20ms.), but this is not an error.

⑥ Search module indicator

This indicator comes on if th corresponding module is addressed by a support tool. For more details, see the instruction manual for the relevant JW-series support tool.

⑦ Fuse alarm indicator

This indicator is provided only on output modules. It comes on if any of the output circuit protection fuses have blown.

(2) ZW-series I/O modules

- ① I/O module cover (no cover on ZW-32N1T/32N2T/16S4D/32S1T/32S2T/32S4T)
This cover shields the fuses ④ and I/O terminal block ⑦ to prevent possible shock hazard.
- ② Guide pins (2 pins)
These pins guide the I/O module while it is being inserted into a basic or expansion rack panel slot.
- ③ Retention screws (2 screws)
Use these screws to secure the I/O module to the basic or expansion rack panel frame.
- ④ Fuse holders and fuses (no fuses on input modules)
These fuses protect the circuits from short-circuit failure.
- ⑤ Card-edge connector
Plug this connector into the mating receptacle on the basic or expansion rack panel.
- ⑥ Rating plate
- ⑦ I/O terminal block (ZW-32N2T/32S2T modules have two row terminal blocks.)
Use this terminal block to connect I/O cable wires from I/O devices. Since it is detachable from the I/O module housing, you can replace the module without having to disconnect the cable wires from the terminal block.
- ⑧ I/O connector
Connect an I/O device cable to this connector.
- ⑨ Device address label
This label is supplied with the control module as an accessory. Affix it according to the slot position of the individual I/O module. The device address represents the 2nd, 3rd, and 4th digits of a relay number.
- ⑩ Fuse alarm indicator
This indicator is provided only on the output modules (ZW-32S1T/32S2T). It comes on if any of the output circuit protection fuses have blown.

Note 1: For details of the data input module, data output module, data output module (source type), and pulse catch module, see the instruction manual supplied with each module.

•Removing the terminal block

Loosen the top and bottom screws retaining the terminal block and remove the block from the module housing.

Note 2: The terminal block retention screws cannot be removed from the terminal block.

[2] Outline dimension drawings
(1) JW-series I/O modules

(Include the rack panel)

(Unit: mm)

(2) ZW-series I/O modules

(Unit : mm)

[3] Description of I/O module relay numbers

Specify the type of I/O modules (JW or ZW) to be used by setting the control module DIP switches. (see page 29).

(1) Using JW-series I/O module (JW-I/O mode)

In the JW-I/O mode, relay number is identified by rack panel numbers and slot numbers.

1) Setting relay numbers

Relay number allocated by auto I/O registration or manual I/O registration using support tool. I/O registration mode is decided by the data of system memory #0247.

- Auto I/O registration : Set automatically according to installed modules.
- Manual I/O registration : First address of rack panel and dummy points for a vacant slot can be set optionally.

• Max. I/O points and I/O relay areas

Model name	Auto I/O registration		Manual I/O registration	
	Max. I/O points	Max. I/O relay areas	Max. I/O points	Max. I/O relay areas
JW50, JW50H	512]0000 to]0077	512]0000 to]0727]0740 to]1007
JW70, JW70H	1024]0000 to]0177	1024	
JW100, JW100H	3776]0000 to]0727	4096	

* The area not using for I/O relay can be used for auxiliary relay area.

• The method of auto I/O registration and manual I/O registration

		Auto I/O registration	Manual I/O registration
Registration method		The installed state is automatically registered each time the PC is powered up. The installed modules are assigned addresses in sequence beginning with]0000. The data registers for the special I/O modules are assigned addresses in sequence beginning with 49000, apart from the addresses for the I/O modules. Vacant slots are not assigned points. <ul style="list-style-type: none"> •If auto I/O registration has been selected and power is rapped after a failure occurs at an I/O module, the I/O address registration may shift, resulting in malfunctions. After completing the I/O installation and correct registration, write 003 ₍₈₎ into system memory location #0247.	When the PC is powered up, auto registration is not performed and I/O addresses can be manually assigned only with the registration operation using a support tool. Dummy points for a vacant slot, the top address of a rack panel and data registers for a special I/O module all can be manually assigned. <ul style="list-style-type: none"> •Perform all manual I/O registration settings from the setting menu of the support tool. (System memory cannot be used to perform these settings.) Refer to page 61 for how to use support tools in manual I/O registration.
Contents of registration	Dummy points	Cannot be set	0 to 240 dummy points can be set (in 16 point increments) for each vacant slot
	Top address of rack panel	Cannot be set	Top address can be set for each rack panel (basic rack panel: rack 0 is fixed at]0000)
	Data registers for special I/O module	<ul style="list-style-type: none"> •Top addresses are assigned from 49000 in the installed sequence. •The number of bytes available for each number is set at 64 bytes. •A maximum of 47 special I/O modules can be installed. 	<ul style="list-style-type: none"> •Top addresses can be manually assigned (relay area also) •The number of bytes in a module can be set to a maximum of 256 bytes. •Unlimited number of special I/O modules can be installed (provided the maximum number of I/O points is not exceeded).

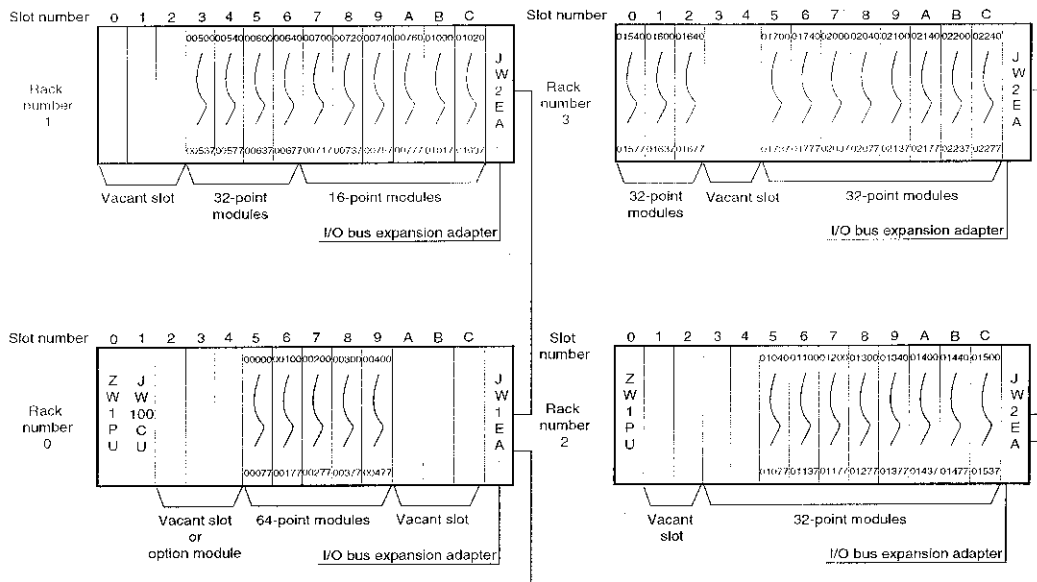

2) Auto registration procedure

MEMORY PROTECT
(Setting value of system memory #0247)

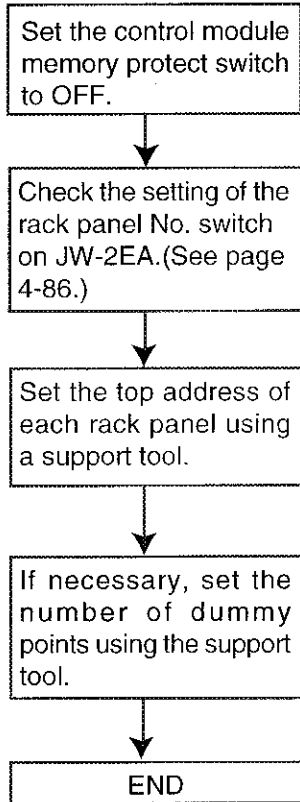

Setting value	Address of I/O module	Address of special I/O module data register
000 ₍₈₎	Auto I/O registration (Auto registration at power ON)	Auto I/O registration (Auto registration at power ON)
001 ₍₈₎	Manual I/O registration (Manual operation)	
002 ₍₈₎	Auto I/O registration (Auto registration at power ON)	Manual I/O registration (Manual operation)
003 ₍₈₎	Manual I/O registration (Manual operation)	

- When the system memory clean is given, its set value is 000₍₈₎.
 - *1 In this case address of I/O module or address of special I/O module data register are registered automatically.
 - 2 If auto I/O registration has been selected and power is reapplied after a failure occurs at an I/O module, the I/O address registration may shift, resulting in malfunctions.
- After completing the I/O installation and correct registration, write 003₍₈₎ into system memory location #0247.

- Note 1: Vacant slots or slots installed option modules are ignored (registered as zero point). Special modules are registered as 16 points of I/O relay.
- Note 2: Relays are assigned consecutive numbers referred to the first I/O address (relay address 00000:]00000) of rack panel No. 0 rack panels are also assigned consecutive numbers referring to the rack panel number setting on the I/O bus expansion adapter.
- Note 3: The number of dummy points cannot be specified.
- Note 4: Rack panel No. 0 is permanently assigned to the rack panel where the control module is installed.

2) Auto registration procedure

MEMORY PROTECT

(The support tool for manual I/O registration)

- Hand-held programmer : JW-10PG/12PG/13PG/14PG
- Multi-purpose programmer: JW-30PG/32PG, JW-40PG/50PG
- Ladder software: JW-50SP, JW-100SP

For details on how to set the top address of rack panel and the number of dummy points, see the instruction manual for the support tool.

① Setting the rack panels' top address

If the top address of rack panel 1, 2, and 3 are set to J0100 to J0200, and J0300, respectively, the module and relay numbers are allocated as follows:

- Note 1: The top address of rack panel No. 0 is always]0000. Address]0000 is not usable for rack panel No. 1 to 7.
- Note 2: Avoid double definition of the same relay number in two rack panels with consecutive rack panel numbers.
- Note 3: Rack panel numbers are determined by referring to the rack panel number setting on the I/O bus expansion adapter.
- Note 4: If the top address of rack panels and/or the number of dummy points is specified, the manual I/O registration mode is selected, in which the rack panels' top addresses, the number of dummy points, and the device addresses of installed module are recalculated.

② Setting the number of dummy points

When in the manual I/O registration mode, you can specify the number of dummy points for vacant slots or slots installed option modules in the range of 0 to 240 points in 16-point increments.

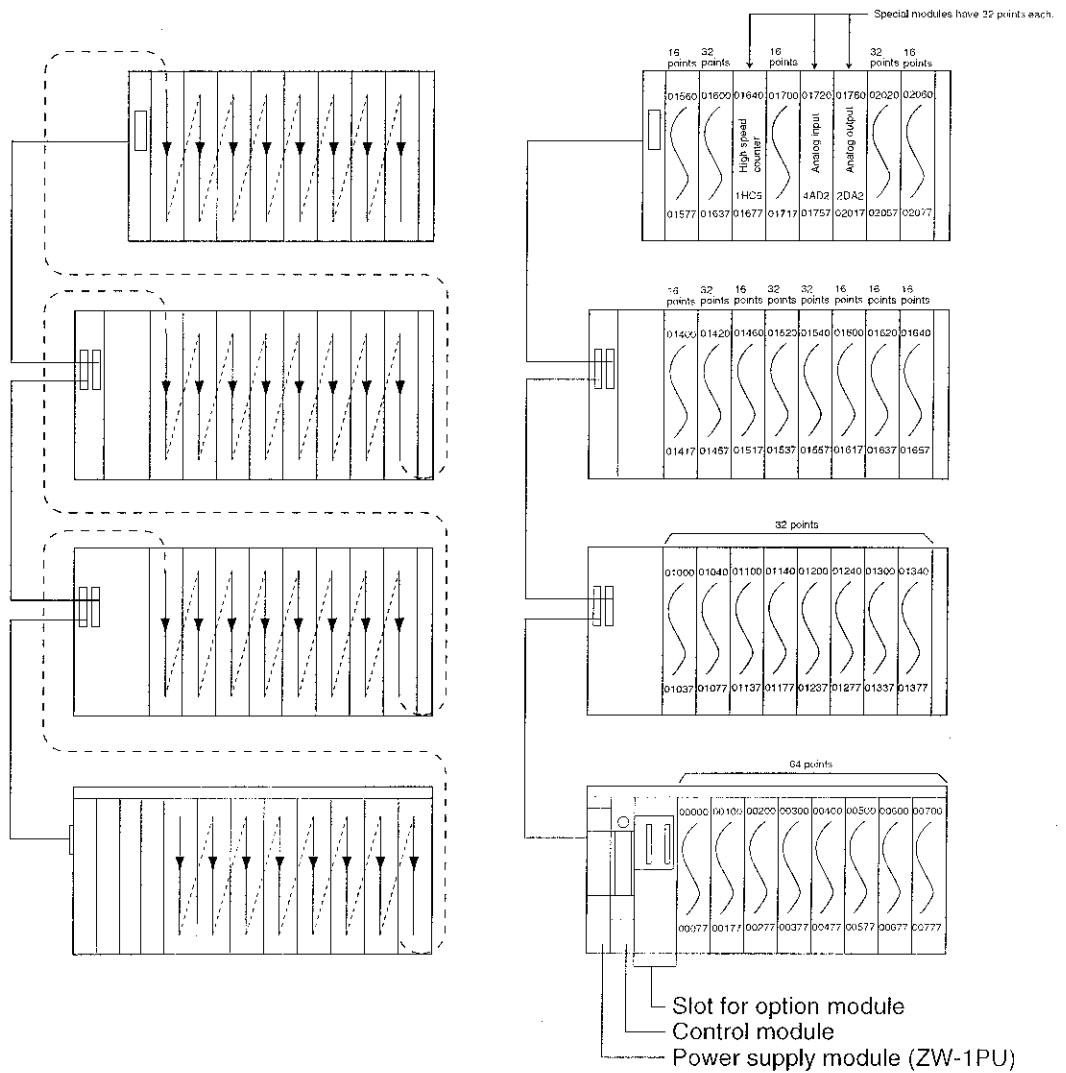

- Note 1: No dummy points may be specified for slots where I/O, special modules are installed.
- Note 2: Vacant slots or slots installed option modules for which no dummy point is specified are registered with a null dummy point.
- Note 3: If an I/O, special module is installed in a slot for which non-null dummy points are specified (even if the module has the same number of relay points as that of the specified dummy points), the PC will stop due to an I/O error.
- Note 4: For details on how to specify the number of dummy points, see the instruction manual for the support tool.
- Note 5: For details on the I/O bus expansion adapter (JW-1EA/2EA), see page 4-84 of this manual.

** Dummy points are useful to : **

- When reserving for I/O modules needed for future system expansion.
- When transplant a program into another system with partially different I/O configuration.

(2) Using ZW-series I/O modules (ZW-I/O mode)

ZW-series I/O modules' relay numbers are defined in sequence according to the sequential order of slots in which the modules are installed. The following shows an example of the system where 64-, 32-, and 16-point I/O modules are used (JW100/100H):

Relay numbers are sequentially defined from top to bottom, and from left to right, with the topmost relay in the first I/O module (which is next to the option module) assigned number 00000.

We recommend that you attach device address labels (which are supplied with the control module) to the front panels of I/O modules with the corresponding slot numbers. The address given in the labels represent the lower three digits of byte address (Jxxxx):

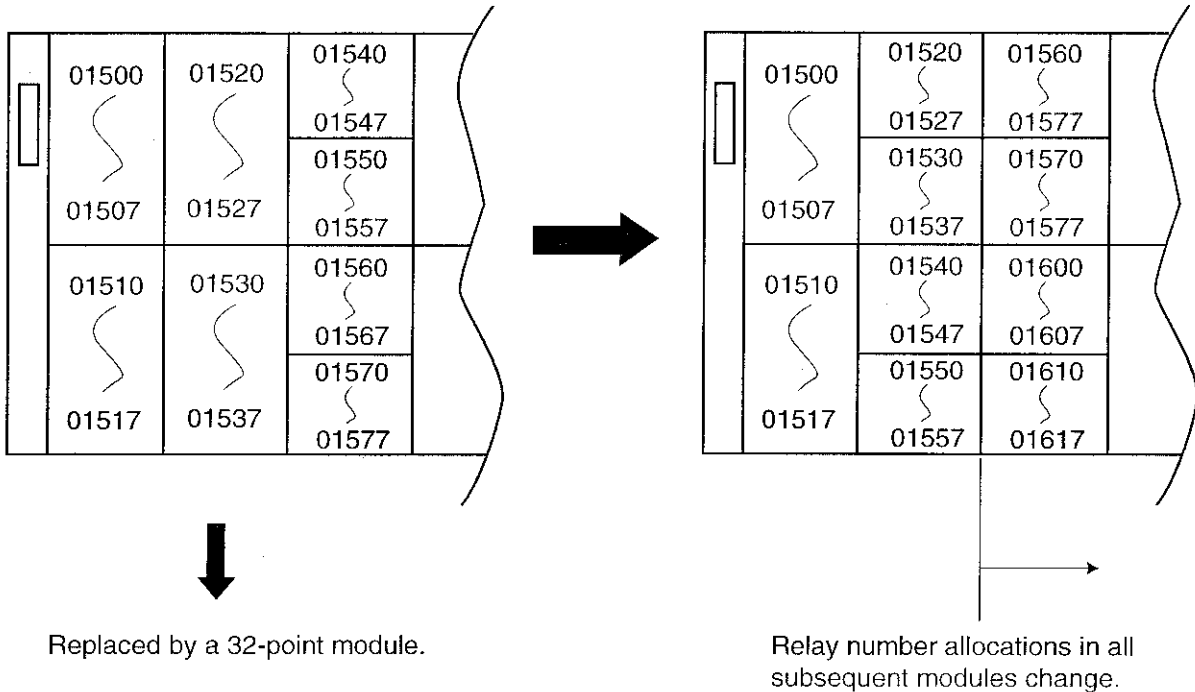

Byte address of J0200 appears as 200 on the label.

J0200

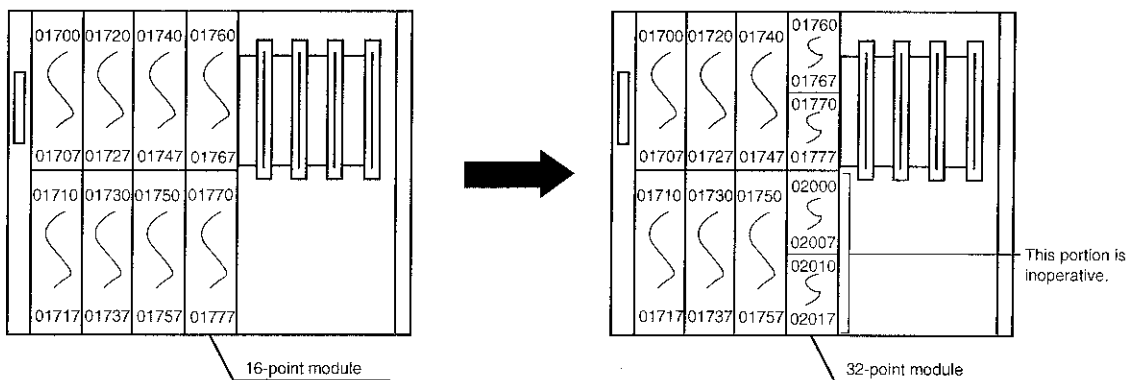

└── Address indicated on a device address label (lower 3 digits)

Note 1: In a standard system configuration, a control module can control up to 32 ZW-series I/O modules. The maximum number of controllable I/O points is 512 using the JW50/JW50H, 1024 using the JW70/JW70H, and 2048 using the JW100/100H. If more than 32 I/O modules are required, use an I/O expansion module, see page 4-93 of this manual.

Note 2: If an I/O module with a given number of relays is replaced with another with different number of relays, the leading number all allocations in all subsequent modules will change:

Note 3: The maximum number of controllable I/O points is 512 using the JW50/JW50H, 1024 using the JW70/70H, and 2048 using the JW100/JW100H. If I/O modules are installed which provide more than these maximum numbers of I/O points, an I/O error will occur. Using the JW70/JW70H, if a 32-point module is installed in slot A of the last rack panel as shown below, an I/O error will occur. (In this example, too many special modules are used. It is not possible to build a 1024-point system using only 16-point modules.)

Note 4: If a special module has an invalid I/O address, that module will remain inoperative.

[4] Precautions for operating input module

1) ON/OFF time of the input signal

In order to ensure ON/OFF condition of the input device correctly (limit switch etc.) on the operation of the JW50H/70H/100H, ON or OFF time should meet the following conditions.

ON time of the input device (T_{ON})	$T_{on} > \Delta t + t_{on}$
OFF time of the input device (T_{OFF})	$T_{off} > \Delta t + t_{off}$
	Δt One scanning time of PC
	t_{on} OFF to ON response time of the input module
	t_{off} ON to OFF response time of the input module

In the input/output process at the beginning of each scanning cycle, ON/OFF state of the logic side of the input module is written in the data memory and used as input data for operation of the user's program within its scanning cycle. Therefore, if ON or OFF time of the logic side of the input module is less than one scanning time (Δt), ON/OFF data may not be included in the data memory.

Note: The response time of the input module is made by the electricity charge/discharge characteristics of the integral circuit of the input module, and it varies depending on the time of duration of ON or OFF.

toff shows the difference, shown in the above, between the case when the ON time of the contact point of the input device is longer as shown by dotted lines and the case when the ON time is shorter as shown by solid line.

(Calculation example in case the ZW-16N2 is used as an input module)

If one scanning time is 5ms,

$$T_{on} > \Delta t + t_{on} = 5 + 15 = 20 \text{ (ms)}$$

$$T_{off} > \Delta t + t_{off} = 5 + 20 = 25 \text{ (ms)}$$

2) Connectable input device

The followings are sensors and switches which can be connected as input. See below for selection and connection of the input device.

• DC input device

①

②

③

④

⑤

• AC input device

⑥

⑦

Note 1: In cases of ①, ②, ③, ④, and ⑤, use a transistor having current driving capacity larger than that of the constant input current of the DC input module.

Note 2: In cases of ④, only an input module with a non-polarized input circuit can be used.

Note 3: In cases of ① and ⑦, pay attention to leakage current at OFF. (When leakage current is higher than the OFF input current level of the input module, the proximity switch may not turn OFF.)

Be careful that voltage output type DC input device shown in the right may not be connected. (Driving capacity of an output transistor should be higher than the ON level of the input module).

3) Countermeasure for leakage current on input device

In the following device, there is also leakage current at OFF. If the leakage current is higher than the OFF level of the input module, the input module may not turn OFF, or noise margin at OFF state may drop.

a. Limit switch with LED

Reference

Calculation of leakage current i_L

$$i_L = \frac{V - V_F}{R_s + R_{in}}$$

V: Power supply voltage

V_F : Voltage drop in the forward direction of LED

R_s : Current limit resistance

R_{in} : Input impedance of input module

b. Limit switch with neon lamp (the neon lamp is connected in parallel with the contact point.)

c. Proximity and photo switches of AC two lines system

In the AC two lines system, even at OFF there is leakage current from current consumption of the internal circuit, and this might prevent the input module from falling in the OFF state. This is nominated as "leakage current" in the specifications of photo switches etc. Make sure that this value is less than the OFF level of the input module.

d. Built-in triac, thyristor and contact point output of surge killers

Some device has CR device as a surge killer for the purpose of avoiding the check mistakes of triac and thyristor, and the leakage current of this CR may prevent the input module from falling in the OFF state. In such a case, the best remedy is to remove the CR. If this is not possible, use the C value of the CR of less than 0.033 μF for 100 VAC; and that of less than 0.015 μF , for 200 VAC.

Reference

Calculation of leakage current i_L

$$i_L = \frac{V}{2\pi fc}$$

V: Power supply voltage

f: Power frequency (50/60Hz)

C: Capacitor

Countermeasure : Connection of bleeder resistance
 As a countermeasure, a bleeder resistance can be inserted in the input side of the input module as shown below.

Choose the bleeder resistance value R to meet the following conditions:

$$i_L = \left(\frac{R_{in} \times R}{R_{in} + R} \right) < V_{in\ OFF}$$

Composite impedance of the bleeder resistance and the input impedance

$$R < \left(\frac{V_{in\ OFF} \times R_{in}}{R_{in} \times i_L - V_{in\ OFF}} \right) \times 0.5 \text{ Margin}$$

- i_L : Current leakage of the input device
- $V_{in\ OFF}$: Input of the input module OFF level voltage
- R_{in} : Input impedance of the input module
- V : Input power supply voltage

In this case, the rating electric power W is,

$$W > \frac{V^2}{R} \times 3 \text{ Margin}$$

[Example] In case that the ZW-32NT is used as an input module at the input power supply voltage of 24 V, and that the leakage current of the input device is 5 mA,

- $i_L = 5 \text{ mA}$
- $V_{in\ OFF} = 6 \text{ V}$
- $R_{in} = 2.6 \text{ k ohm}$
- $V = 24 \text{ V}$

$$R < \frac{6 \times 2.6}{2.6 \times 5 - 6} \times 0.5 = 1.11 \text{ k ohm}$$

If R is 1 k ohm,

$$W > \frac{24^2}{1 \times 10^3} \times 3 = 1.73 \text{ W}$$

W will be 2 W.

4) Notes for long-distance wiring and by-pass wiring

In the AC input module, when the cables to external device are very long or wiring along with power lines is made, the input module might be turned ON in spite of the OFF command in the input device, due to leakage current and inducement by floating capacity among cables.

Countermeasure 1: Connect a bleeder resistance and a CR surge killer in parallel with the input module to reduce the composite impedance of the input module.

The smaller the R value, the more effective. However, when R becomes small, power consumption ($\frac{V^2}{R}$) increases. Therefore, note the R's watt value.

C: 0.033 to 0.33 μ F
(Pressure resistance of over 250 VAC)
R: 47 to 120 ohm

Countermeasure 2: Change the input power supply to DC (use DC input module).
In general, the direct current signals are little affected by floating capacity and inducement.

Countermeasure 3: Close circuit by making use of the b contact.
When the b contact is used to make a close circuit at OFF, very little induced voltage is generated.

Note: Do not wire the input signal line near and in parallel with power lines of a motor and an inverter.

5) Surge current of the AC input module

There is surge current in the AC input module, when turning ON the input.

The surge current of the AC input module is determined by constants (R, C) of the input circuit inside the module, power supply voltage at ON input, phase, power supply current capacity and wiring impedance. The surge current stated in the AC input module specifications is the worst value for the case of the ON input at the maximum impressed voltage and at the peak phase.

If, in certain input device, contact points are affected (adhered etc.) by the surge current, the surge current should be reduced by connecting a limit resistance R_s outside the module as shown below.

The following limit resistances R_s can be connected outside the module:

- For 100 VAC input module, less than 2 k ohm (over 2 W rate electricity)
- For 200 VAC input module, less than 4 k ohm (over 2 W rate electricity)

Reference

- When a limit resistance of 2 k ohm (or 4 k ohm) is connected for the 100 VAC (or 200 VAC) input module, the surge current becomes less than 80 mA at the peak ON.

Note: If a resistance bigger than the above value is connected, the input ON/OFF levels and the response times cannot be guaranteed.

Module name	Surge current specifications
JW-11N	Max. 480mA (0.2ms or less, 132 VAC peak ON)
JW-13N	Max. 500mA (0.2ms or less, 264 VAC peak ON)
JW-31N	Max. 480mA (0.2ms or less, 132 VAC peak ON)
ZW-16N1	Max. 365mA (0.4ms or less, 121 VAC peak ON)
ZW-16N3	Max. 342mA (0.4ms or less, 242 VAC peak ON)
ZW-32N1	Max. 440mA (0.2ms or less, 121 VAC peak ON)

6) Countermeasure in case of connection of induced load to input signal

If the induced load is connected to the input signal, in order to absorb the noise, connect a surge killer near the load for the AC circuit; and a diode, for the DC circuit, as shown below.

For AC power supply

Surge killer: R, C
C: 0.033 to 0.33 μ F
(Resistance voltage of over 250 VAC)
R: 47 to 120 ohm

For DC power supply

Diode:

Peak inverse voltage (V_{RM}) should be more than 3 times bigger than the load voltage, and the average rectification current should be bigger than load current.

[5] Precautions for operating the output module

1) Protection from output short circuit

In case of a short circuit of the load connected to an output terminal, output devices and print board may be burned. Be sure to insert a protection fuse in the output.

Some modules have a built-in fuse per common line for protection of the module from heating and burning due to excessive current. It is not intended, however, for protection of the output devices and load from excessive current; therefore, insert fuse for each line outside the module. This is also advisable from maintenance point of view.

2) Countermeasure to surge current of lamp load

At turning ON an incandescent lamp, there is surge current 10 to 20 times bigger than normal current for several 10ms. For reduction of the surge current, insert either a bleeder resistance or an electric current limit resistance.

a. To insert a bleeder resistance

During the OFF state of the output module, keep supplying dark current so small as to turn ON the lamp dimly.

b. To insert an electric current limit resistance

This limits the current within a value determined by the value of the current limit resistance. When the resistance value is high, the voltage on the lamp decreases. Determine the resistance value by the brightness needed when turning ON the lamp.

3) Countermeasure to surge voltage at opening/closing induced load

Some load generates surge voltage of several thousands volt when an induced load is opened or closed its circuit. All output module except the relay output module have a circuit to absorb surge within module. However, when the wiring to the load is long, its effectiveness is reduced and a surge countermeasure is required in the load side as well. In case of the relay output module without surge absorption circuit, surge countermeasure outside the module is indispensable in case the load generates high voltage. (This surge voltage countermeasure can extend the life time of the contact points of the relay.)

Surge voltage countermeasure

Relay output module

Relay contact point output module

Transistor output module, FET output module

Triac output module

C: 0.033 to 0.33 μ F (Pressure resistance of over 250 VAC)
R: 47 to 120 ohm

Example of CR surge killer

For 100 VAC	953M2503 10411(0.1 μ + 120 ohm) (made by Matsuo Electric Co., Ltd.)
For 200 VAC	953M5003 33311(0.033 μ + 120 ohm) (made by Matsuo Electric Co.,Ltd.)

Peak inverse voltage (V_{RM}) is more than three times of the load voltage.
Average rectified current (I_o) is more than load current.

In case of AC load, a varistor can be used in place of the CR surge killer for the same effect.
(Installation of both of the CR surge killer and the varistor increases the effect.)

For 85 to 132 VAC	TNR12G221K (made by Marcon Co., Ltd.), NV220D14 (made by NEC)
For 170 to 264 VAC	TNR12G431K (made by Marcon Co., Ltd.), NV430D14 (made by NEC)

Note 1: Avoid the use of a capacitor only as an arc killer, as shown below:

Note 2: DC output module uses a zener diode as a surge absorber within the module. In case of using an induced load of large load current such as solenoid valves, note the followings:

Applicable models
JW-12S
JW-32S
JW-35S
ZW-32S2TD

D: Diode for counter surge voltage absorption at OFF

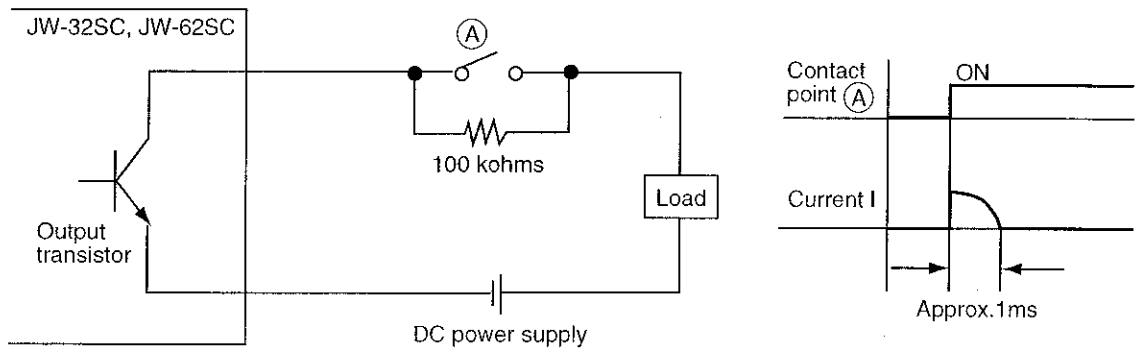

- When the load current is an induced load of over 0.3 A(0.8A for JW-12S), use the module with the open/close frequency at less than 30 times/min. (1 sec. ON/1 sec. OFF or so).

JW-12S	0.5A
JW-32S	
JW-35S	0.3A
ZW-32S2TD	

- When more frequent opening/closing, a surge countermeasure for counter voltage absorption is needed in the load side. When the load current is an induced load of over 0.5 A(0.8A for JW-12S), a surge countermeasure for counter surge voltage absorption is indispensable in the load side.

JW-12S	0.8A
JW-32S	
JW-35S	0.5A
ZW-32S2TD	

- The output transistors of JW-32SC and JW-62SC may turn ON for a moment when the contact point (A) turn OFF to ON under the connection with the load in series, even if the output data from PC is OFF. Therefore, the load which response under 1ms may turn ON for a moment. To protect the abnormal processing, connect 100k ohms resistor between the contact point (A).

4) Load which can be driven by the AC output module

The AC output module with SSR as an output device can drive directly the loads of electro-magnetic switches, solenoid valves and lamps. In such cases note the surge current at turning ON (from OFF to ON) and the maintenance current during the maintenance state (ON state). Concretely, use the module within the following range:

Model name	Load voltage range	OFF to ON transient	Holding	
		Allowable repetitive surge current	Min. holding current	Max. rated load current
JW-13S	15 to 264 VAC	6A (100 ms)	10 mA	2A (1 point), 4A(8 points comment)
JW-33S		6A (100 ms)	10 mA	1A (1 point), 4A(16 points comment)
ZW-8S1	15 to 121 VAC	8A (100 ms)	30 mA	2A (1 point), 5A(4 points comment)
ZW-16S1		8A (100 ms)	30 mA	2A (1 point), 4A(8 points comment)
ZW-32S1T		6A (100 ms)	10 mA	0.6A (1 point), 2.4A(8 points comment)
ZW-16S3	15 to 242 VAC	8A (100 ms)	-	2A (1 point), 5A(8 points comment)

The ZW-32S1T has two versions with different minimum operating currents :

OUT PUT AC100V(N): 15A(50 ms) or less

OUT PUT AC100V : 50 mA (former version, not produced after Feb.1988.)

- When the AC output module drives the load, note the surge current at turning ON and the holding current during the maintenance state. Keep the surge current below the repeated allowed surge current at the turning ON; and keep the maintenance current, over the minimum action current and below the maximum rated load current during the maintenance state.

- The repeated allowable surge current is a value in case of the pulse width below 100 ms and repeated switching frequency below 20 times/minute. When, in case of the load of a motor, the pulse width of the surge current is large and that the switching frequency is high, keep the ON time of 1 pulse below 50%.

(When the repeated surge current is below the maximum rated load current, there is no limit in the pulse width or in the switching frequency.)

- When many loads with big surge current are driven within a same common line circuit, make the number of points which turn from OFF to ON at the same time minimum. When a strong surge current goes through a built-in fuse in a common unit, the built-in fuse may be damaged or fused. The number of the surge current per common which can be turned from OFF to ON at the same time is determined by a fusing property of the built-in fuse as follows (as a guidance):

Below 15A (50ms)

Below 10A (50ms)

The numbers in () are pulse widths.

- For a light load of the holding current which is smaller than the minimum action current, some characteristics of load may prevent turning OFF. In such a case, connect a bleeder resistance in parallel with the load to increase the maintenance current up to the minimum action current or more.

Some electro-magnetic switches of the pulse-driven cannot be turned OFF even if the holding current is over the minimum action current. In such a case, also, connect a bleeder resistance in parallel with the load. (Select a value of the bleeder resistance so that it can allow the minimum action current by itself.)

Calculate the value R of the bleeder resistance in the following formula:

$$R < \frac{V}{I}$$

V: Power supply voltage
I: Minimum action current of the output module

Then, the capacity of R (W) is

$$W > \frac{V^2}{R} \times 3$$

5) OFF delay time when the DC output module drives the induced load

When the DC output module with a built-in clamp diode is used as a surge killer to drive the induced load of direct current such as electro-magnetic valves and solenoid valves, it may be impossible to complete high-speed switching due to the delay of response, since electric current goes to the load through the clamp diode. In such a case, the DC output module with a built-in zener diode, instead of the clamp diode, could speed up the response.

DC output module with a built-in zener diode
JW-12S
JW-32S
JW-35S
ZW-32S2TD

6) Driving a load current of 1A or more (2A max.) from a JW-series DC output module

The JW-12S output module uses FETs in its final stage. It can thus drive a load current of up to 2A if two FET outputs are connected in parallel.

Note 1: For parallel driving, be sure to turn both OUT1 and OUT2 on or OFF simultaneously.

Note 2: Be sure to use a flywheel diode in parallel with the load.

Note 3: The allowable surge current is not doubled by the parallel connection. It remains 4A(100 ms).

Note 4: The JW-32S is not capacity of doubling its output capacity by parallel connection (1A max.)

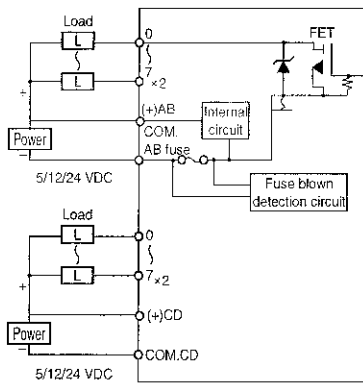

7) External power source

DC and relay output modules require external power sources to supply DC output modules with output transistor's base current, and relay output module's coil driving current. Connecting an external power source also makes any output module's internal flywheel diodes effective. If a DC output module is used with no external power source connected to it, the internal flywheel diode will remain ineffective and the output transistors may sustain damage.

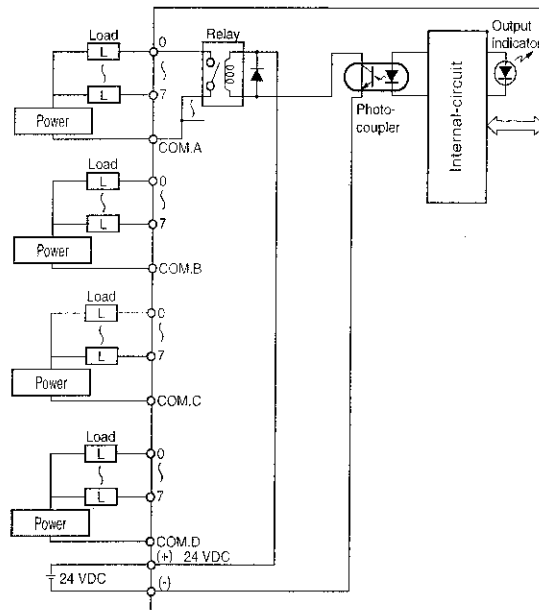

Supply destination		Module's terminal block or connection pins	System rack panel 24 VDC terminal block
Module name	DC output modules	JW-12S JW-32S ZW-32S2 ZW-32S5 ZW-32S2T ZW-35S ZW-32S5 ZW-32S2TD ZW-64S2	ZW-8S2 ZW-16S2
	Relay output module	JW-34S ZW-16S4D ZW-32S4T	ZW-16S4

- For DC output modules, one power source should, as a rule, be shared for both the external and load power supplies.

[Example for connrction]

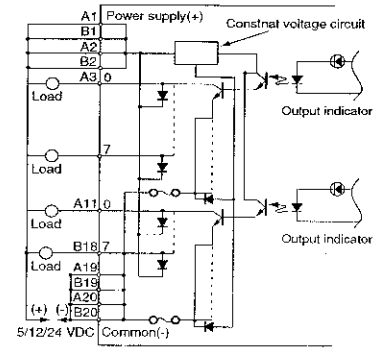

In case of JW-12S/32S

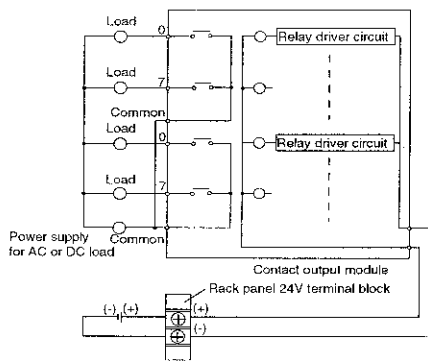

In case of JW-34S

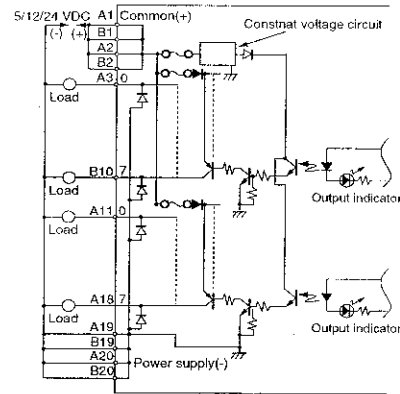

In case of ZW-16S2/8S2

In case of ZW-32S2

In case of ZW-16S4

In case of ZW-32S5

In case of ZW-32S2T

In case of ZW-32S2TD

Note 1: External 24 VDC power supplied to the 24 VDC terminal block on a rack panel is shared by any of ZW-8S2, ZW-16S2, and ZW-16S4 module installed.

Using separate power sources for the external and load power supplies

a. When external supply voltage is lower than load supply voltage (see page 4-49 note)

The load may be activated by a load current (I_{OUT}) passing through the output module's flywheel diode.

When $V_1 < V_2$:

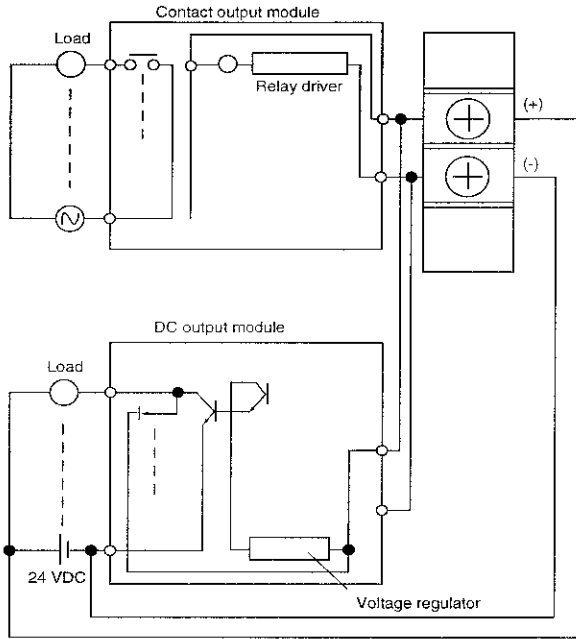

b. Power ON/OFF sequence (see page 4-49 note)

When powering up the system, first turn the external power source ON, followed by the load power supply. When turning the system power OFF, first turn the load power supply OFF, followed by the external power source. If this power ON/OFF sequence is not followed, the load will malfunction.

c. When using both DC and relay output modules on one rack panel:

1) When a DC output modules is used to drive 24 VDC loads, connect the 24 VDC load power supply terminals to the pertinent terminals on the basic or expansion rack panel's 24 VDC terminal block.

2) When a DC output modules is used to drive 12 VDC loads, connect an external 24 VDC loads, connect an external 24 VDC power source (which is separate from the 12 VDC load power supply) to the 24 VDC terminal block on the basic or expansion rack panel, and connect the negative terminal of the terminal block to that of the terminal block on the basic or expansion rack panel, and connect the negative terminal of the terminal block o that of the load power supply. The separate 24 VDC power source is needed for driving the relays 1 within the relay output modules.

Note: Using the JW-12S/JW-32S/ZW-32S2TD output modules with zener diodes as surge suppressors can prevent load malfunction due to loop current. Also, they may be used in the circuit with separate external and load power supplies as shown:

8) Driving micro loads with relay output modules

The relays used in relay output modules are suited for driving relatively high-power loads. For low-power loads rated, for example, at 24 VDC , 10mA, the reliability of the relay contacts will be reduced. For low-power applications, we recommend that you use DC output modules with transistor outputs. If the use of low-power relay contacts is necessary, use external low-power miniature relays with high contact reliability and drive them from either a DC or relay output module as shown:

9) Life of relays of the relay output module

The relay's life of the module (JW-34S, ZW-16S4, ZW-16S4D, ZW-32S4T), which uses a relay in output circuit, varies depending on the kind of loads (difference of the power rate of the signal on the contact point is AC or DC and its current value). The following shows characteristic curves of the relay contact point.

Note 1: The above chart shows standard values.

Depending on the environment of usage (ambient temperature and humidity), different life may result.

Note 2: When the signal to the contact point is DC, the life of relays varies according to the load rise characteristics (time constant: T) of the load. The load rise characteristics of the load after the contact point is turned ON are determined by inductance: L and resistance: R

$$\left(T = \frac{L}{R} \right)$$

For the time constant of the load used, see below:

In case of resistance load: $T < 1\text{ms}$

In case of small size relay: $T = 7\text{ms}$

In case of large current L load and magnet: $T = 40\text{ms}$

In case of the L load with a diode for surge countermeasure, the life of relays may be similar to the case of $T < 1\text{ms}$.

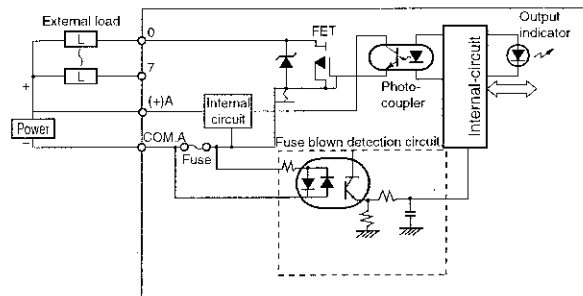

Note 3: When magnetic value containing rectification current (diode) is load, full-wave rectification should be used. Half-wave rectification makes the life shorter.

Note 4: Use the relay output module, with the contact switching life of more than 100,000 times and within the current capacity of less than 2A.

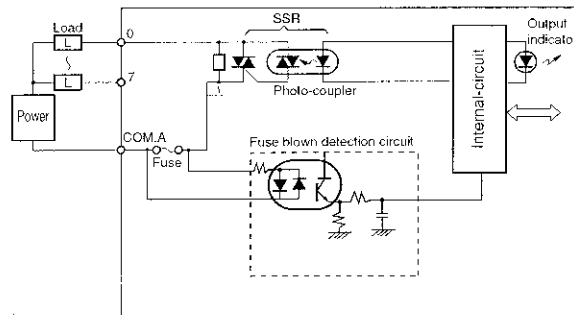

10) Fuse blown detection on JW-series output modules

Model name: JW-12S, JW-32S, JW-33S, JW-35S

The JW-12S, JW-32S, JW-33S, and JW-35S DC output modules have an internal fuse failure detection circuit as shown below. Due to the circuit configuration, it can detect fuse failures only if load power is present at the module outputs. If no load power is present, the fuse indicator light on the output module and fuse OFF plug (7363) to the control module will both remain OFF, even when a failure exists.

JW-12S/JW-32S

JW-33S

[6] Precautions for operating the special I/O module

1) Scan time (ZW-I/Os)

ZW-series special I/O modules perform data and command transfer with external devices through I/O relays controlled by an internal microprocessor. For this reason, each scan time must be set longer than the internal processor's execution cycle time. If it is set shorter than the cycle time, a data transfer error will occur.

(Unit for processing time : ms)

Module name	Model name	Processing time	Module name	Model name	Processing time
High-speed counter module	ZW-1HC5	2	Pulse catch module	ZW-14PC2	0
High-speed counter module	ZW-1HC6	0	Pulse output module	ZW-1PO2	2
Analog input module	ZW-4AD2	2	Positioner module	ZW-112PM	3
Analog output module	ZW-2DA2	2	Serial I/O module	ZW-232SU	3
Interface module	ZW-10DU	6			

Note 1: JW-series special I/O modules need no consideration for scan time setting.

a. Checking scan time setting

The current scan time setting can be checked by reading the contents of system memory address #0032 and #0033:

System memory	#0032	Lower BCD digit
	#0033	Upper BCD digit

b. Setting scan time (constant scan)

If the preset scan time is shorter than the special I/O module's execution cycle time, set system memory address #0226 to the appropriate value:

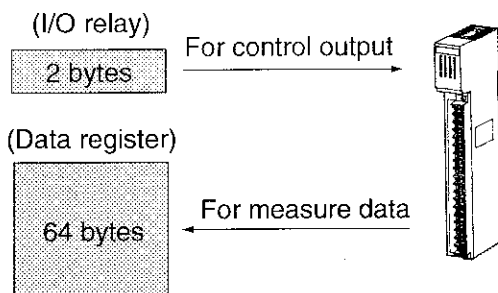

Zero cross 07367	Set in #0226	PC's scan time
OFF	Invalid(BCD)	Zero-cross sync.
ON	00(BCD)	Zero-cross sync. (minimum scan)
ON	01 to 99(BCD)	Scan time of 01 to 99ms

2) Special I/O module installation

Special I/O modules handle high-frequency pulses and/or low currents. Do not install them in slots next to slots where relay output modules (JW-34S/ZW-16S4/ZW-16S4D/ZW-32S4T) are installed.

3) JW-series special I/O modules

I/O operations through JW-series I/O modules access two data memory areas for I/O relays and data registers. For more information, read the programming manual, section 4-1.

4-6 Power supply module (JW-1PU: Approved UL/CSA)

[1] Name and function of each part

Note 1: For fuse replacement procedure, see page 11-5.

- ① Retention screws
Use these screws to secure the power supply module to the rack panel frame.
- ② Power indicator
Comes on when +5V power is available.
- ③ Rating plate
- ④ Terminal block (8 pin)
Connect cable wires for power, ground, and the halt output signal to this terminal block. Also used for input voltage selection.
- ⑤ Halt output fuse (1A normal class)
Use a glass-tubed fuse with 250V, 1A rating for the halt output circuit.
- ⑥ Front cover
Remove this cover to gain access to the fuse.

[2] Outline dimension drawings

[3] Specifications

Item	Specifications	
Rack panel slot	Power supply module slot in basic rack panel (ZW-28KB/46KB) or rack panel (ZW-08BU or JW-4BU/6BU/8BU/13BU)	
Input power	Input voltage	100 VAC to 120 V+10% (85 to 132 VAC) - 15%
		200 VAC to 240 V+10% (85 to 132 VAC) - 15%
	Input frequency 47 to 66 Hz	
Power consumption	Max. 55 watts (at 7A output current)	
Surge current	Max. 40 A(10 ms or less) with rated load and at 240 VAC input	
Leakage current	Max. 1 mA at 240 VAC input	
Output voltage	5.1 VDC \pm 0.05 V	
Output current	0 to 7A	
Output rise time	20 to 200 ms at rated load	
Output hold time	Min. 15ms at rated load	
Protection circuits	Overcurrent protection	Voltage-drop, auto-recovery type (8.8 to 9.6A)
	Overvoltage protection	Shut-off, manual-recovery type (6.0 to 6.75 V)
Protection fuses	AC power input	Time-lag miniature fuse with 2A rating (internal mounting) (Approved to UL/CSA/)
	Halt output	Normal blow miniature fuse with 1A rating (front mounting) (Approved to UL/CSA/)
Halt output	Function	Triac output, shut OFF if control module stops functioning
	Load voltage	85 to 264 VAC
	Load current	0.5 A max.
	Leakage current	Max. 3mA
Insulation resistance	Min. 10M ohms when measured with a 500 VDC megohmmeter	
Dielectrical strength	Withstands 1500 VAC for 1 minute.	
Power indicator	Green LED	
Terminal block	For primary input and halt output connections (terminal block detachable)	
Connector	44-pin DIN connector	
Outer dimensions	33.5(W) \times 250(H) \times 104.5(D)	
Weight	0.7kg	
Accessories	Normal blow miniature fuse with 250 V, 1A rating:t (Approved to UL/CSA/)	

Input voltage selection is accomplished by mounting a metal short across the appropriate terminals on the terminal block.

Note: The power supply module is designed for installation in a rack panel (ZW-08BU, JW-4BU/6BU/8BU/13BU) only. It cannot be installed in an expansion rack panel.

[4] Input voltage selection

The primary supply voltage to the power supply module can be selected as 100 VAC or 200 VAC. The default selection is 100 VAC position on the terminal block. To select 200 VAC, move it to the 200 VAC position.

Note 1: Never supply 200 VAC to the power supply module with the input voltage selection left at 100 VAC, or the module will sustain permanent damage.

Note 2: Take care not to lose the metal short if you have temporarily removed it from the terminal block.

Note 3: The input voltage tolerance for the expansion power supply modules (ZW-100PU1/ZW-100PU2) is 100 VAC + 10%/15% or 200 VAC + 10%/-15%.

Note 4: The following schematic shows the JW-1PU's halt output circuit:

[5] Power supply capacity

The JW-1PU power supply module has a rated load capacity of 5 VDC, 7A. The ZW-100PU1/100PU2 expansion power supply modules have capacities of 5 VDC, 7A(PU1) and 5 VDC, 12 A(PU2). If the load current exceeds these ratings, the power supply module's internal current limiter will be activated to shut off the 5V supply to all other modules. During system design, set the total current consumption by I/O modules below the rated load capacity of the power supply module to be used.

Note 1: n₁; I/O points turn ON, n₂; I/O points turn OFF.

3) Memory module

Model name	Current consumption (mA)	Model name	Current consumption (mA)
ZW-1MA	100	JW-1MAH	130
ZW-2MA	100	JW-2MAH	135
ZW-3MA	100	JW-3MAH	145
ZW-4MA	180	JW-4MAH	185

[Example 1]

JW-50CUH control module	
JW-13PG hand-held programmer	
JW-34N	11 sets
JW-32S	5 sets
JW-33S	8 sets

The maximum allowable current load for the JW-2PU power supply module is 5A.
Do not exceed this limit.

The total current required when all I/O points are turned ON is:

JW-50CUH	0.55A
JW-13PG	0.2A
JW-34N	$0.089 \times 11 = 0.979A$
JW-32S	$0.217 \times 5 = 1.085A$
JW-33S	$0.505 \times 8 = 4.04A$
<hr/>	
Total	6.854A

This total current is acceptable because it is below the JW-1PU power supply module's maximum allowable current load(7A).

[Example 2]

JW-50CUH control module	
JW-13PG hand-held programmer	
JW-34N DC input module	11 sets
JW-33S AC output module	10 sets
JW-10CM link module	3 sets

The total current required when all I/O points are turned ON is:

JW-50CUH	0.55A
JW-13PG	0.2A
JW-34N	$0.089 \times 11 = 0.979A$
JW-32S	$0.505 \times 10 = 5.05A$
JW-10CM	$0.2 \times 3 = 0.6A$
<hr/>	
Total	7.379A

The total current exceeds the JW-1PU's maximum allowable load current. Now determine the maximum possible number of I/O points that can be simultaneously turned ON. If we assume that 300 out of 352 inputs and 300 out of 320 outputs are simultaneously turned ON, then the total current required is recalculated as follows:

JW-50CUH	5.5A
JW-13PG	0.2A
JW-34N	$0.025 \times 11 + 0.002 \times 300 = 0.875A$
JW-32S	$0.025 \times 10 + 0.015 \times 300 = 4.75A$
JW-10CM	$0.2 \times 3 = 0.6A$
<hr/>	
Total	6.975 A

This total current is acceptable because it is below the JW-1PU power supply module's maximum allowable current load(7A).

4-7 JW-2PU Power supply module

[1] Name and function of each part

Note: For fuse replacement procedure, see page 11-5.

- ① Retention screws
Use these screws to secure the power supply module to the rack panel frame.
- ② Power indicator
Comes on when +5V power is available.
- ③ Rating plate
- ④ Terminal block (8 pin)
Connect cable wires for power, ground, and the halt output signal to this terminal block. It is also used for input voltage selection.
- ⑤ Halt output fuse (1A normal blow)
Use a glass-turned fuse with 250V, 1A rating for the halt output circuit.
- ⑥ Front cover
Remove this cover to gain access to the fuse.

**The JW-2PU is designed for a maximum allowable load current of 5A.
The total current requirement for the system should not exceed this limit.**

[2] Outline dimension drawings

Weight	Approx. 1kg	
Accessories	Normal blow miniature fuse with 250 V, 1A rating:1	

Note: The JW-2PU power supply module is designed for installation in a rack panel (ZW-08BU) only. It cannot be installed in an expansion rack panel.

[4] Direct voltage source for power supply module

The following specifies the requirements for the direct voltage source for the JW-2PU power supply module:

(1) Voltage fluctuation

The voltage fluctuation in the primary DC power source's output should not exceed the following range:

Input voltage range: 20.4 to 32.0 VDC

Note 1: If batteries are to be used as a primary DC power source, verify that both charged and discharged battery voltages fall within the input voltage range specified above.

Note 2: If a rectified AC power is to be used as a primary DC power source, verify that its ripple voltage does not exceed the input voltage range specified above.

3-phase, half-wave rectified power

○ Acceptable

Single-phase, hull-wave rectified power

× Unacceptable

(2) Current capacity of primary DC power source

Determine the required current capacity to the primary DC power source from the power consumed by the JW-2PU power supply module under maximum loaded condition. Since the JW-2PU consumes a maximum of 40 watts under maximum load (5A), the capacity required of the primary power source is: $40 \text{ W}/24 \text{ V} \doteq 2\text{A}$.

[5] Other notes

(1) Guaranteed power-lapse interval

If a primary DC power source is to be switched on-line in the event of a power failure, the switching time should not exceed 10 ms. If it exceeds 10ms, the CPU may enter a power failure service sequence. If you wish to extend this interval, change the setting in system memory address #0246. It can be varied over 0 to 255 ms, although some restrictions may apply depending on the number of I/O and/or option modules used. For the details of how to change the interval setting, see the programming manual, section 2-4, "System memory description".

(2) Zero-cross synchronization

With the JW-2PU DC power supply module, zero-cross synchronization remains ineffective. This means that completion of one operation on the PC is immediately followed by another operation.

[Reference]

If you wish to use a constant scan time. Use the scan time fixing feature, which is set using system memory address #0226 and the zero-cross switch (relay #07367):

Scan time	System memory #0226	Zero-cross switch 07367
Unfixed	00 (H)	
01 to 99ms	01 to 99ms (H)	ON

Circuit to close the zero-cross switch

Note 1: For zero-cross switch (07367) operation and system memory setting, see the instruction manual for the support tool you are using.

Note 2: The following shows the schematic of the JW-2PU power supply module's halt circuit: (Figure)

4-8 ZW-100PU1/100PU2 expansion supply module

[1] Name and function of each part

① Power supply module cover

Remove this cover when you wish to:

- Establish power, halt output, and other cable connections to the terminal block,
- Replace a fuse, or
- Switch primary supply voltage.

Be sure to keep this cover installed on the module when it is being operated.

② Cover retention screw, ③ Cover retention screw hole, and ④ Hinge

These are used to secure the front cover.

⑤ Terminal block (12 pin)

Connect power, halt output, and other necessary cable wires to this terminal block.

⑥ Power fuse (2A)

This fuse is inserted in the module's primary supply circuit. Use a tubed minifuse with 250 V, 2A rating.

⑦ Halt output fuse (1A)

This fuse is inserted in the module's halt output circuit.
Use a glass-tubed fuse with 250 V, 1A rating.

- ⑧ Power supply voltage selector switch
This switch allows you to select the primary supply voltage to the expansion power supply module as 100 VAC or 200 VAC. The default selection is 100 VAC.
- ⑨ Locking plate retention screw, ⑩ Switch locking plate
These are used to lock the voltage selector switch into the selected position to prevent inadvertent selection of the wrong voltage.
- ⑪ Rack panel retention screws
Use these screws to secure the expansion power supply module to the expansion rack panel frame (ZW-108ZB, etc.)

[2] Outline dimension drawings

[3] Specifications

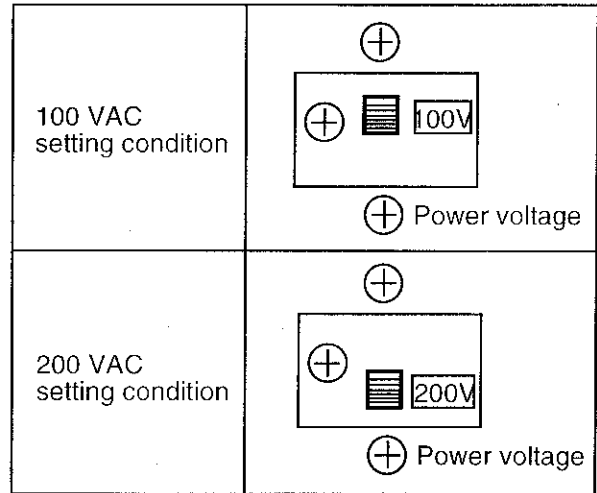

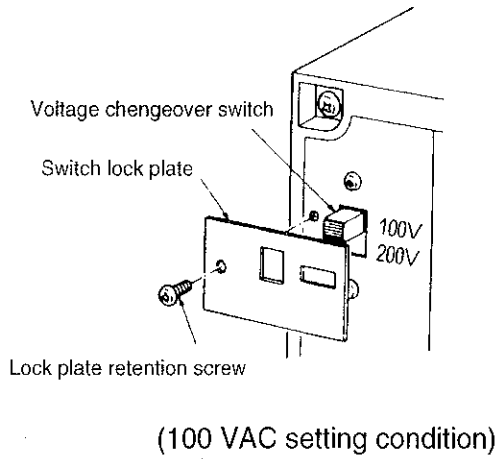

Item	ZW-100PU1	ZW-100PU2
Applicable rack panel	ZW-108ZB/ZW-104ZB/ZW-102ZB	
Input voltage	Primary supply voltage	100 VAC+10%(85 to 110 VAC) -15% 200 VAC+10%(170 to 220 VAC) -15%
Power drawn	Max. 40 watts (at 7A output current)	Max. 100 watts (at 12A output current)
Surge current	Max. 20 A, 10 ms(at 220 VAC input, rated load)	
Leakage current	Max. 1 mA at 220 VAC input	
Output voltage	5.1 VDC \pm 0.05 VDC	
Output current	0 to 7A	0 to 12A
Output rise time	20 to 200 ms at rated load	
Output hold time	Min. 15ms at rated load	
Protection circuits	Overcurrent protection	Voltage-drop, auto-recovery type (7.7 to 8.4A)
	Overvoltage protection	Voltage-limiting, auto-recovery type (6.0 to 6.75A)
Protection fuses	AC power input	Normal blow miniature fuse with 2A rating (front mounting)
	Halt output	Normal blow miniature fuse with 1A rating (front mounting)
Halt output	Function	Triac output, shut OFF if the control module stops functioning
	Load voltage	85 to 240 VAC
	Load current	1A
	Leakage current	3 mA max.
Insulation resistance	Min. 10M ohms when measured with a 500 VDC megohmmeter	
Dielectrical strength	Withstands 1500 VAC for 1 minute.	
Terminal block	For primary input and halt output connections	
Outer dimensions	65.5(W)×250(H)×130(D)	
Weight	1.5 kg	
Accessories	Normal blow miniature fuse with 1A and 2A ratings: 1 each	

Primary supply voltage is selectable with a front panel switch.

Note: The ZW-100PU1/100PU2 power supply module cannot be installed in a basic rack panel or in the ZW-508ZB expansion rack panel.

[4] Primary supply voltage switching

The primary supply voltage to the ZW-100PU1/100PU2 expansion power supply modules is selectable as 100 VAC or 200 VAC using a front panel switch. The default selection is 100 VAC. If you wish to operate the module on 200 VAC, change the voltage selection in the following sequence:

- 1) Remove the locking plate retention screw.
- 2) Remove the switch locking plate.
- 3) Set the voltage selector switch to 200 VAC.
- 4) Replace the switch locking plate over the switch, this time with its reverse side facing forward so that it locks the switch tab into the 200 VAC position.
- 5) Secure the plate with the retention screw.

Note 1: Never supply 200 VAC to the expansion power supply module with the supply voltage selection left at 100 VAC, or the module will sustain permanent damage.

Note 2: The tolerance of primary supply voltage for the expansion power supply module is not identical to that for the ZW-1PU power supply module. Take care to avoid using the expansion power supply module outside the supply voltage tolerance specified.

Note 3: The following schematic shows the ZW-100PU1/100PU2's halt output circuit:

4-9 JW-1EA/2EA I/O bus expansion adapter

[1] Outline and features

The JW-1EA/2EA I/O bus expansion adapter (hereafter called the JW-1EA/2EA) are used for bus interconnection among racks which contain JW-series I/O modules. The JW-1EA is used solely in the rack panel where the control module is installed, whereas the JW-2EA is used in all rack panels other than the first rack panel.

Containing high-speed line drivers and receivers, the JW-1EA/2EA allow reliable transmission over longer distance than that available with a conventional expansion signal cable:

- 1) The allowable total cable length from the first to the last rack panel in a daisy chain is 50 meters (160 feet).

- 2) Remote programming capability allows you to program system operations, change an existing program, or monitor a running program, using a support tool attached to a rack panel which is up to 50m (in cable length) away from the rack panel where the control module is installed.

- 3) I/O module installed in the farthest rack have processing speeds equivalent to those in the control rack panel. Communication time delay inherent in conventional remote I/O is eliminated.

- 4) Power supply modules' halt output signal lines need not be connected in a daisy chain. If any of the power supply modules fail, the PC automatically stops running and the halt output signal of all the power supply modules are simultaneously activated (contact opened).

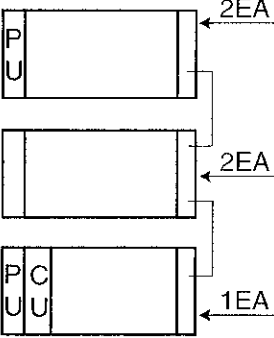

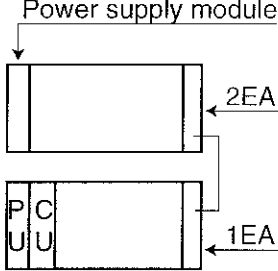

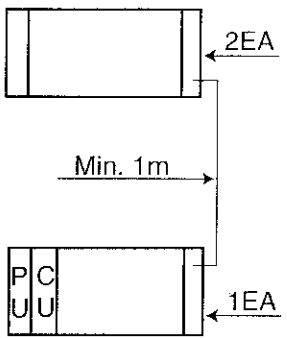

- 5) One control module can control up to eight rack panels including the one where the control module is installed.

[When the I/O bus expansion adapter is used]

In the following cases, an I/O bus expansion adapter is necessary.

①	②	③
<p>Three or more rack panels are connected.</p> 	<p>Although the quantity of connected rack panels are two, the expansion rack panel another power supply module. (The total current consumption of modules exceeds the capacity of the power supply module, the expansion rack panel needs power supply module.)</p> 	<p>The length of I/O expansion cable exceeds 1m. (In this case, the expansion rack panel needs another power supply module.)</p> 

[Some notes on bus extension cabling]

- The total length of the I/O expansion cables used should not exceed 50m. (50m in one direction, 100m in both direction)
- Do not install I/O expansion cables in ducts or conduits where cabling to I/O devices or power cables are installed.
- Plug each I/O expansion cable plug firmly into its mating receptacle. Loose connections may cause an I/O error, causing the PC to stop running.
- Be sure to install the termination connector the JW-1EA/2EA at both ends of the I/O bus. Also keep the connector cover installed on every unused connector.
- Do not apply a tensile stress of more than 2kg to the I/O expansion cables.
- When using the I/O expansion cable over a distance greater than 1m, be sure to use an expansion power supply module in the expansion rack panel.
- The JW-1EA is supplied with two termination connector. Take care not to lose them while unpacking.

[2] Name and function of each part

① Module retention screw (two sets)

Use these screw to secure the module to the rack panel frame.

② RUN indicator

This light remains on while the PC is normally running; it goes off if an error has occurred or the PC has entered the program mode.

③ I/O expansion connectors

Use these connectors to establish I/O bus connections among expansion rack panels.

④ Rating plate

⑤ Support tool interface connector

Connect your support tool (hand-held programmer, etc.) to this connector.

⑥ Rack panel number selector switch

Rack No.

Use this switch to set the rack panel number (1 to 7) which the module is connected. Select rack panel No.0 for the rack panel where the control module is installed (default setting is No.1), and allocate ascending numbers to the rest of the rack panels from near to far. Avoid allocation of the number to more than one rack panel.

⑦ Termination connector

Install this connector on the JW-1EA/2EA at both ends of the I/O bus. The JW-1EA comes with two termination connector (for more details, see page 4-89).

⑧ Connector cover

Keep this cover installed on every unused I/O connector. The JW-1EA is supplied with two connector covers.

⑨ Termination connector slot

[3] How to use

(1) Installation

Install the JW-1EA/2EA in the I/O expansion connector located on the right-hand side of the JW-4BU/6BU/8BU/13BU rack panel as shown:

Use the JW-1EA in the rack panel (where the control module is installed); use the JW-2EA in expansion rack panels.

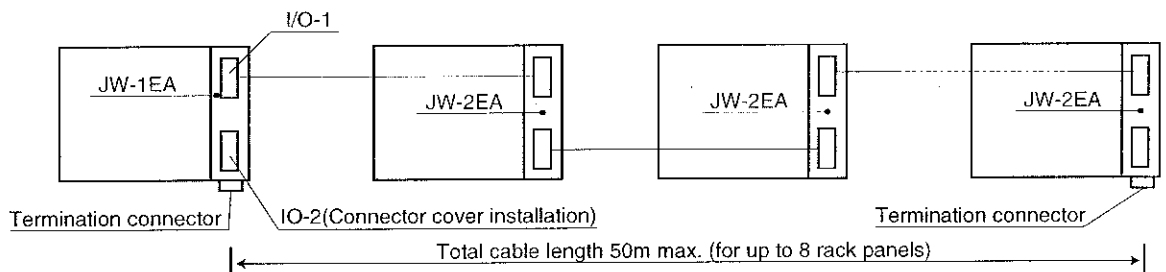

Note: Allow a space of more than 50mm (2 in.) on the right-hand side of the JW-1EA/2EA to enable insertion/removal of the termination connector.

(2) Bus connections

There are two possible ways of bus connection. Choose according to the operating conditions and purpose.

Method	Description	Status
Using one I/O expansion connector on the JW-1EA	Use this format for a single bus with a total bus length of max. 50m.	
Using one I/O expansion connector on the JW-1EA	Use this format for two buses with a total bus length of max. 50m each.	

1) Method using either I/O expansion connector on the JW-1EA either of the two I/O expansion connectors (IO-1 and IO-2) on the JW-1EA may be used for I/O bus extension, as shown below:

*For the first (JW-1EA) and last (JW-2EA) adapters, install bus termination connector in their termination plug slots and connector covers over the IO-2 connectors.

*Set a range 1 to 7 for a rack panel number. Avoid definition of the same device number for more than one rack panel. Numbers 0, 8, or 9 are usable for device numbers JW-2EA.

Note: No restriction exists regarding whether you use IO-1 or IO-2 connector on each adapter. Use whichever is more convenient.

2) Method using either I/O expansion connectors on the JW-1EA

Both of the I/O expansion connectors (IO-1 and IO-2) on the JW-1EA may be used for I/O bus extension, as shown below:

- *The maximum total cable length allowable for each I/O expansion bus is 50m.
- *Install a bus termination plug and connector cover on the last adaptor on each bus.
- *The maximum total number of rack panels are attached to JW-1EA module's IO-1 connector, up to 3 rack panels may be attached to its IO-2 connector.
- *Set a range 1 to 7 for a rack panel number. Avoid definition of the same device number for more than one rack panel. Numbers 0, 8, or 9 are usable for device numbers JW-2EA.

3) I/O expansion cables

The following I/O expansion cables are optionally available for the JW-1EA/2EA:

Model name	Specifications
JW-05EC	50 cm long (50 conductor)
JW-1EC	1 m long (50 conductor)
JW-3EC	3 m long (50 conductor)
JW-10EC	10 m long (50 conductor)
JW-30EC	30 m long (50 conductor)
JW-50EC	50 m long (50 conductor)

Note: Clamp the I/O expansion cable to relieve tensile stress on their connections.

(3) Setting the rack panel number selector switch

The JW-2EA has a rotary-type rack panel number selector switch. Set a unique rack panel number for each rack panel using this switch:

Note : Set a unique rack panel number for each rack panel. Numbers 0, 8, or 9 are not usable for rack panel numbers with the JW-2EA.

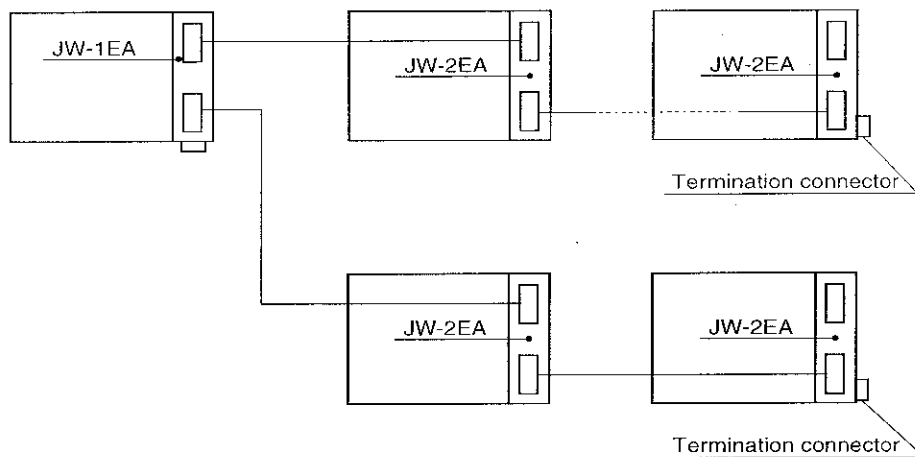

(4) Installing a termination connector

The I/O bus extended with the JW-1EA and JW-2EA must be terminated with a termination connector at each end.

1) For a single I/O expansion connector

2) For double I/O expansion connector

(Reference) Reason needing for termination connector

1. Termination connector must be used at both ends of the I/O bus to prevent signal reflection pulse from the ends of the bus. Otherwise reflection pulse will interfere with the forward signal and cause data errors. Installing a termination connector terminates the end of the bus through a resistor.
2. If a termination connector is installed on an intermediate rack, the resulting reflection and/or attenuation will cause data errors.

The termination connector is installed in the slot provided in the lower section of the JW-1EA/2EA module, as shown below.

Note: The termination connector will only fit oriented one way. Do not forcibly insert it with the wrong orientation, as this will damage the connector and/or receptacle.

(5) Connecting a support tool

The JW-2EA has a support tool interface connector. When attached to this connector, a support tool can be used in much the same ways as if it was attached to the control module.

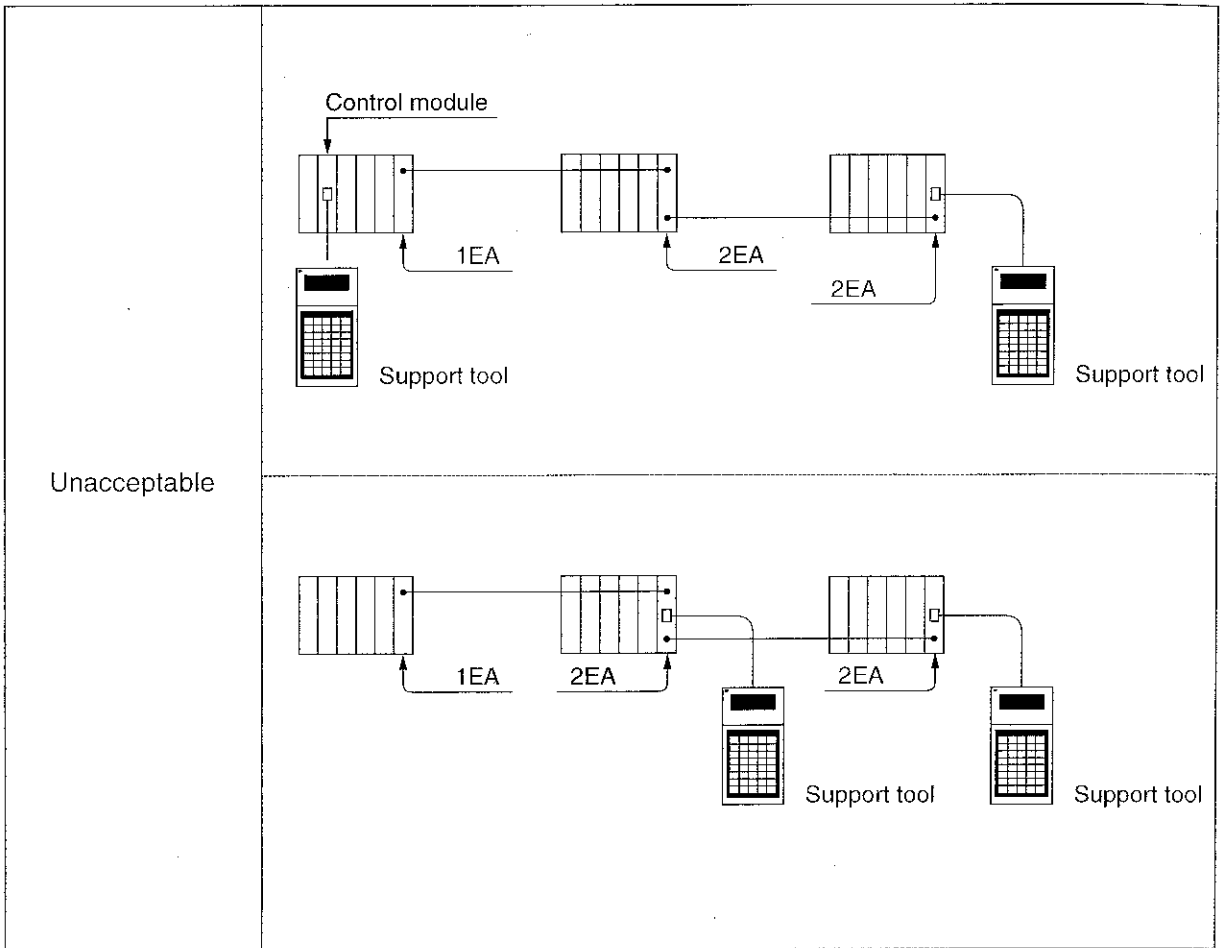

[Connectable support tools]

Hand-held programmer (JW-10PG/11PG/12PG/13PG/14PG)
Programmer (ZW-101PG1) Note 1
Multi-purpose programmer (JW-30PG, JW-32PG, JW-40PG, JW-50PG)
Ladder processor II (Z-100LP2, Z-100LP2F) Note 1

Note 1: Each support tool can be used within the range of its capabilities.

Note 2: Only one support tool can be used with a system at one time. If a support tool is already attached to the control module or any other JW-2EA module in a system, do not attach another to the same system. (Refer to page 11-3.)

[4] Outline dimension drawings

[5] Specifications

	JW-1EA	JW-2EA
Applicable rack panels	JW-4BU/6BU/8BU/13BU	
Total cable length	50 m max. from JW-1EA (per system)	
Applicable I/O expansion cables	JW-05EC (50cm long) JW-1EC(1 m long) JW-3EC(3 m long) JW-10EC(10 m long) JW-20EC(20 m long) JW-30EC(30 m long) JW-50EC(50 m long)	
Internal current consumption	550 mA (5 VDC)	
Weight	0.4kg	
Accessories	Two termination connector	None

4-10 ZW-10EU I/O expansion module

[1] Outline and features

(1) Outline

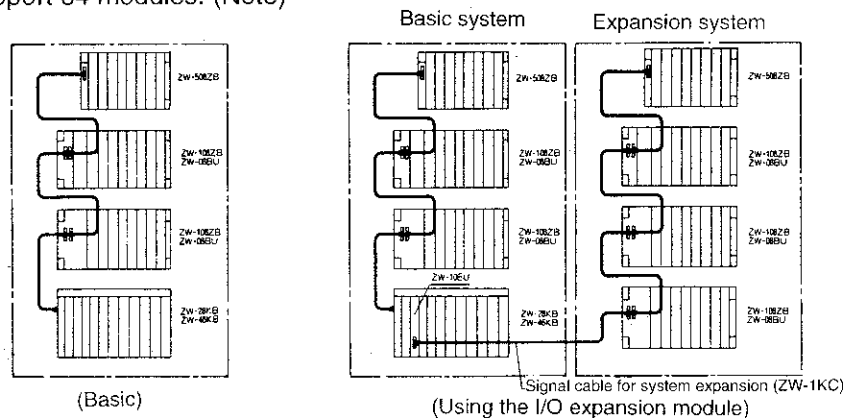

The ZW-10EU I/O expansion module is used to expand the system by allowing additional ZW-series I/O modules to be included. It allows up to 32 ZW-series I/O modules to be added to the basic system, although the number of available I/O points supported is unaffected by the addition of I/O modules past the specified maximum.

PC model name	Max. No. of I/O points	No. of basic I/O modules	No. of all I/O modules when using the ZW-10EU
JW-50CU, JW-50CUH	512	32	64(Note 1)
JW-70CU, JW-70CUH	1024	32	64(Note 1)
JW-100CU, JW-100CUH	2048	32	64(Note 1)

Note: While the ZW-10EU allows the system to be expanded from a 32-module into a 64-module system, the maximum number of I/O points available is not increased by additional I/O modules.

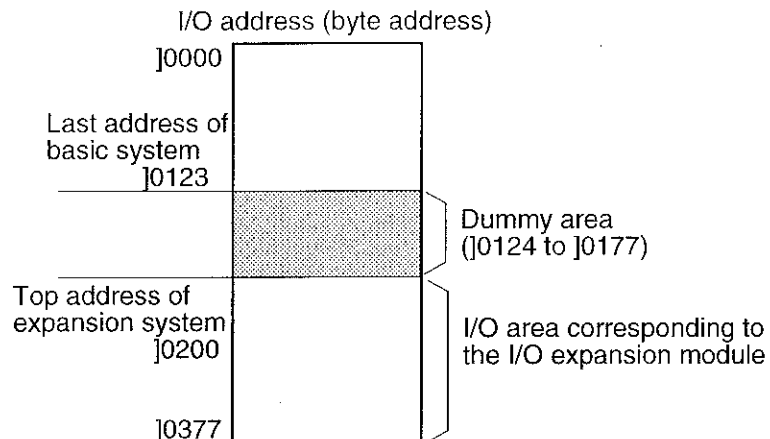

(2) Features

- 1) The ZW-10EU expands the PC system from being able to support 32 modules to being able to support 64 modules. (Note)

Note: A 64-module system consists of 32 I/O modules in the basic system and 32 I/O modules in the expansion system.

- 2) One dummy area be defined without the need for a dummy module. The interval between the last address of the basic system and the top address of the expansion system is defined as a dummy area (see the following figure):

[2] Name and function of each part

① Module retention screws

Use these screws to secure the I/O expansion module to the rack panel frame.

② RUN indicator

When lit, this indicates that the control module is controlling the I/O modules in the expansion port.

③ Address switches

Use these switches to set the last address of the basic port and top address of the expansion port.

Basic system's last address switches: ①

Use these switches to set the last address of the I/O module included in the basic port, using byte address representation.

(Default setting at delivery :]000).

Expansion system's top address switches: ②

Use these switches to set the top address of the I/O module included in the expansion port, using byte address representation

(Default setting at delivery :]200)

④ Ratings plate

⑤ I/O expansion connector (OUT)

Use this connector to connect an expansion signal cable for the expansion port.

⑥ Address switch cover

Remove this cover to gain access to the address switches.

[3] Using the ZW-10EU I/O expansion module

The ZW-10EU is installed in a basic rack panel (ZW-28KB/ZW-46KB) or a rack panel (ZW-08BU used as an expansion I/O rack panel).

(1) Installation configurations

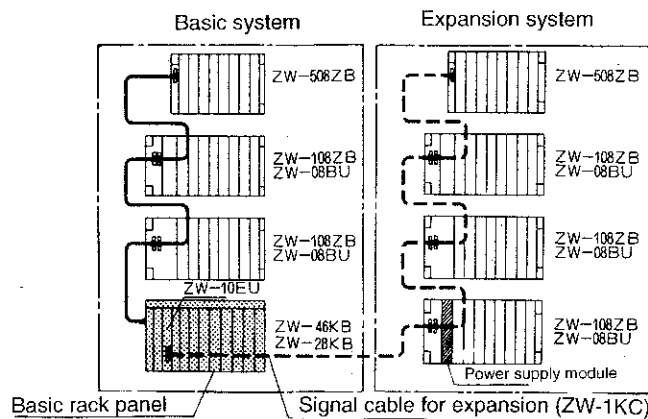

1) Standard installation

When the ZW-10EU is installed in a basic rack panel ZW-28KB/ZW-46KB.

1. Install the ZW-10EU in any one of the option slots in the basic rack panel.
(Example: Installing the ZW-10EU in the ZW-28KB basic rack panel)

2. Use the optional ZW-1KC signal cable for system expansion for connection to and within the expansion system.
3. The total length of the signal cable for system expansion connected to the ZW-10EU should not exceed 4m (dotted line in the figure below).
4. Use a separate power supply module (+5V) to supply the expansion system. Do not supply the expansion port from the basic system's power supply module.

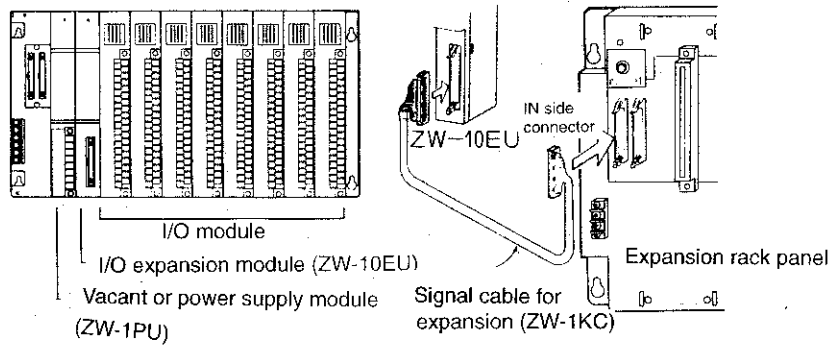

Note : If no module other than the ZW-10EU is to be installed in the option slots, the ZW-2CC position cable is not needed.

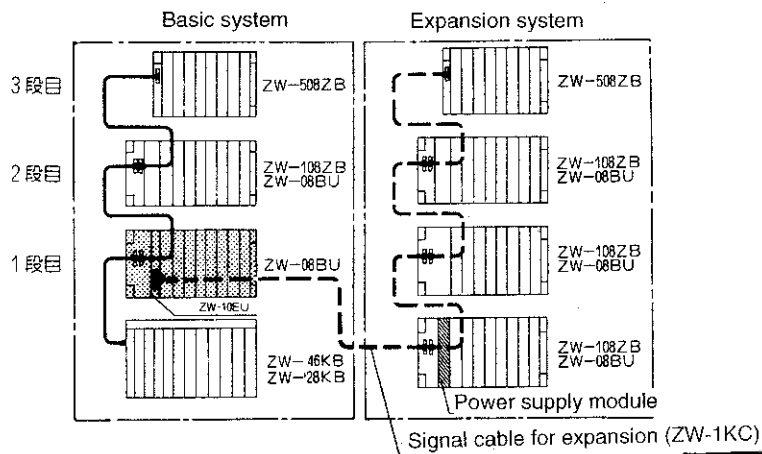

2) Special installation

For special installation, the ZW-10EU is installed in a rack panel in the basic system when all of the option slots in the basic rack panel are occupied.

1. The ZW-10EU is installed in a ZW-08BU rack panel.

2. Install the ZW-10EU into the slot next to the second slot from left slot (which normally holds the control module).
3. The ZW-10EU may be installed in any ZW-08BU rack panel within the basic port.
4. Use the optional ZW-1KC signal cable for system expansion for connection to and within the expansion port.
5. The total length of the signal cable for system expansion connected to the ZW-10EU should not exceed 4m (dotted line in the figure below).
6. Use a separate power supply module (+5V) to supply the expansion port. Do not supply the expansion port from the basic port's power supply module.

(2) Installing the ZW-10EU and setting the address switches

The following describes how to install the ZW-10EU into the basic rack panel and how to set address switches.

Switch the system power OFF.

Install the ZW-10EU into one of the option slots in the basic rack panel.

Remove the address power OFF.

Set the last address (byte address) of the basic system.

To next page.

Note: The ZW-10EU requires no option cable.

Remove the cover by pulling its top edge forward.

Set the last address of the basic system using the upper three address switched A, B and C (address range: 000 to 376) Note 2.

Example) If the last address of the basic system is 01237, it becomes 0123 in byte address representation. Set the lower three digits, 123, of the address using the switches (see the figure at right).

Note 1: Use a slot screwdriver to set the switches.
 Note 2: The address range is 000 to 176 if the JW-70CU, JW-70CUH control module is used.

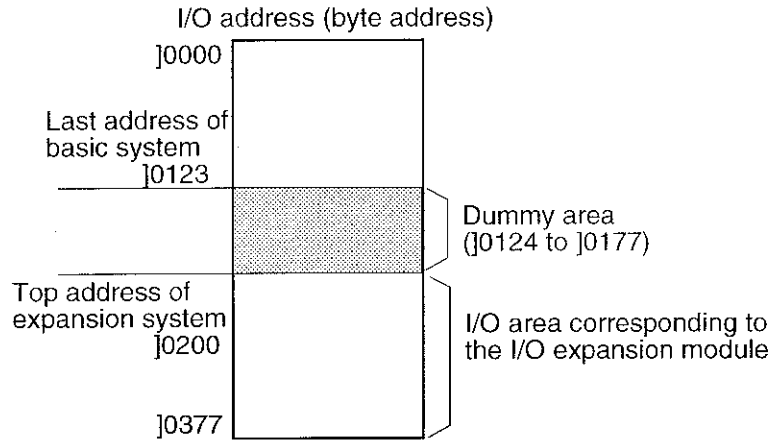

Applicable screwdriver

From previous page

Define dummy address area.

Predefining a dummy area is convenient for future system expansion. The difference between the basic port's last address and expansion port's top address is defined as a dummy area.

Set the top address (byte address) of the expansion port.

Set the top address of the expansion port using the lower three rotary switches:

Setting area	Basic port's last address < Expansion port's top address ≤ 377 (Note 2)
---------------------	---

Example) To set the top I/O address of the expansion port to 02000 (]0200 byte address), set the lower 3 digits "200" of]0200 as shown at right:

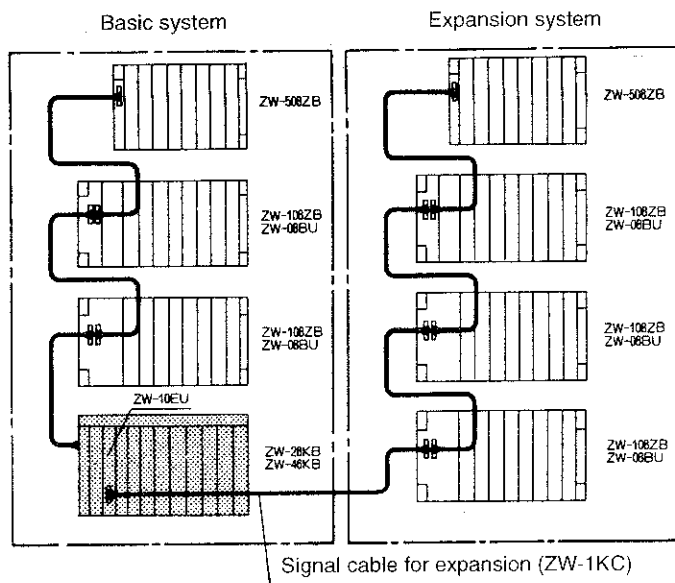

Note 1: Whenever possible, use an even number for the top address of the expansion port. This will make the PC's word instructions easier to use.

Note 2: The allowable address range is 001 to 177 (octal) for the W70H, and 001 to 377 (octal) for the W70H.

To next page.

From previous page

Connect the signal cable for system expansion.

Turn the system power ON.

To next page.

From previous page

Set system memory address #0252

Set the I/O address self-diagnosis function

Specify whether the I/O address self diagnosis feature is to be used or not:

000₍₈₎: Self diagnosis is not used.

105₍₈₎: Self diagnosis is used.

Set system memory address #0252

Write the total number of I/O points (through the last I/O address of the expansion system) into system memory address #0250.

The I/O address self diagnosis feature checks the number of bytes used for I/O in the basic system, dummy area, and expansion system. It is implemented if the value 105₍₈₎ is written into system memory address #0252 (Note 1).

(Example) When using 1056 points of I/O relays up to address J0203, write 204 into system memory address #0250.

J0203(1056 points): 132 bytes : 204₍₈₎

Note 1: For more details, see the programming manual, section 2-4, system memory.

Note 2: If you write 000₍₈₎ into system memory location #0252, location #0250 does not need to be set.

End

(3) Checking system run (RUN indicator)

When the ZW-10EU I/O expansion module is functioning normally, the green RUN indicator on the module comes on. The RUN indicator goes OFF in any of the following cases :

- The power to the ZW-10EU I/O expansion module is turned OFF. The indicator also goes OFF if the power to the top rack panel attached to the module is turned OFF.
- The last address of the basic port is improperly set.
- The ZW-10EU is not connected to the expansion port with a signal cable for system expansion, or no I/O module is installed on the first rack panel in the expansion port attached to the module.

(4) Self diagnosis

The following lists the I/O module self diagnostic features available when the ZW-10EU I/O expansion module is installed :

Self diagnosis	Contents	Basic system I/O signals	Expansion system I/O signals
I/O data bus (error code 44)	I/O bus floating check	Yes	Yes
I/O signal (error code 45)	Input or output module discrimination signal's simultaneous ON check	Yes	Yes
	Input or output module discrimination signal response check	Yes	Yes *Note 2
	Output-data-bus check	Yes	No *Note 2

Note 1: The self diagnostic features above must be specified in system memory addresses #0250 and #0252. For more details, see the programming manual, section 2-4, system memory.

Note 2: The self diagnostic feature does not check the expansion port's I/O signal output onto the data bus.

Note 3: If an error is detected during the self diagnosis, error code 44 or 45 is written into system memory address #0160 and special relay 07373 is activated. For more details, see the programming manual, section 2-8, "Self-diagnosis".

[4] Outline dimension drawings

[5] Specifications

Item	Specifications
Expansion I/O modules supported	Max. 32 modules (64 modules in total)
Length of expansion signal cable	Total 4m
Current drawn	70 mA
Weight	0.3 kg
Accessory	Instruction manual

The general specifications for storage temperature, operating temperature, relative humidity, vibration, impact, and so forth are identical to those given in section 3-5 (page 3-15), "General Specifications".

4-11 Communication port

[1] Outline

The special communication port provided on the JW-70CU/100CU, JW-70CUH/100CUH control module allows the PC to communicate with a personal computer or any other host device with an internal RS-232C/422/485 serial port.

Communication port

[2] Usable commands

The ZW-10CM, JW-10CM link module's computer link commands listed below are available for communication with a host device:

■ Read/Write commands (Note 1)

	Read commands	Write commands
Relay	MRL	SRR (Set/Reset)
Timer/counter/MD	MTC	SRT (Set/Reset)
Register	MRG	WRG FRG (Writ the same data)
File register	RFL RFLF	WFL WFLF (for files 1 to 7)
System memory	RSM	WSM
Program	RPM	WPM CTC (change setting value of timer/counter)

■ Control commands

HLT	Halt PC run
RUN	Restart PC run
MPC	Monitor PC run
VLM	Read memory capacity
SVL	Set memory capacity
EWR	Set write mode
SWE	Read status in write mode

Note 1: When executing a write command to system or program memory, set the control module's memory protection switch to OFF(write enable). Write access to the file registers can be disabled by setting the contents of system memory address #0244.

Note 2: The global address feature (command to write station address 00 into all PCs) is not available.

Note 3: For the JW-70CUH/100CUH, the current value monitor command (MTC) for the timer and counter cannot read 777 or below and 1000 or above simultaneously.

The responses of 1000 and above apply to the ZW mode (without additional information) and not to the JW mode (with additional information).

[3] Setting the communication format

Specify the communication format needed for communication with the host device in the PC's system memory.

System memory	Contents
#0236	Transmission rate, parity bit, stop bit length
#0237	Station No. (001 ₍₈₎ to 037 ₍₈₎)

•Contents of system memory location #0236.

The communication port doesn't operation in the case of writing the other data in the system memory #0236 by WSM command.

[4] Precautions for use of the communication port

(1) The writing mode (modes 0, 1, and 2) can be selected and the operation of the JW70/100 or JW70H/100H PC can be restarted or stopped using external signals input through the communication port or through the support tool connector.

There is no priority for triggers whether they received through the communication port or through the support tool connector. However, the most recent trigger received will take priority over all precious triggers. Therefore, pay attention to the PC operation status (start/stop operation) when operating a support tool or sending a command, as shown in the example below.

Ex.: When you send a RUN command through the communication port after stopping the PC operation using the hand-held programmer, the PC will restart operation with this RUN command. In this case, even if the PC is running, the hand-held programmer can write a program into the PC and this will cause a malfunction.

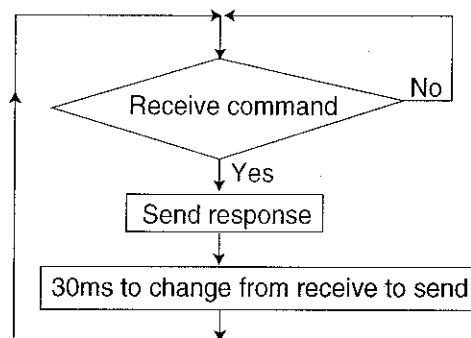

(2) With the JW70/100, if you cannot write data through the communication port, the PC mode may have been changed (from the write mode to the RUN mode) through the support tool connector or the expansion module connector. If this is the case, reset the PC mode.

(3) Command resend wait time

If you want to send another command immediately after receiving a response through the communication port, make sure to wait at least 30 ms.

The communication port needs 30ms to change from its send operation to a receive operation.

(4) We recommend that you reissue the command (retry) when any communication error occurs, including a simple failure to respond. This will not have a negative influence on the system.

[5] Wiring

(1) Port connector pin description

RS-232C

Pin No.	Signal name	Function
1	FG	Protective ground
2	TXD	Transmit data (PC to host)
3	RXD	Receive data (host to PC)
4	RTS	Active whenever the PC power is turned ON.
5	CTS	Clear to send. Transmission is enabled when active ;disables when inactive.
7	SG	Signal ground
12,14	Shorting pins	Short these pins when the port is to be used in RS-232C mode.

RS-422/485

Pin No.	Signal name	Function
1	FG	Protective ground
10	TXD	Transmit data (PC to host)
11	$\overline{\text{TXD}}$	
12	RXD	Receive data (host to PC)
13	$\overline{\text{RXD}}$	
6	Termination resistance	Only the termination station connects to 3 (RXD)

Note : Pin No. 6 (termination resistance) is available on the JW-70CUH/100CUH but not on the JW-70CU/100CU.

(2) In case that target station is RS-232C

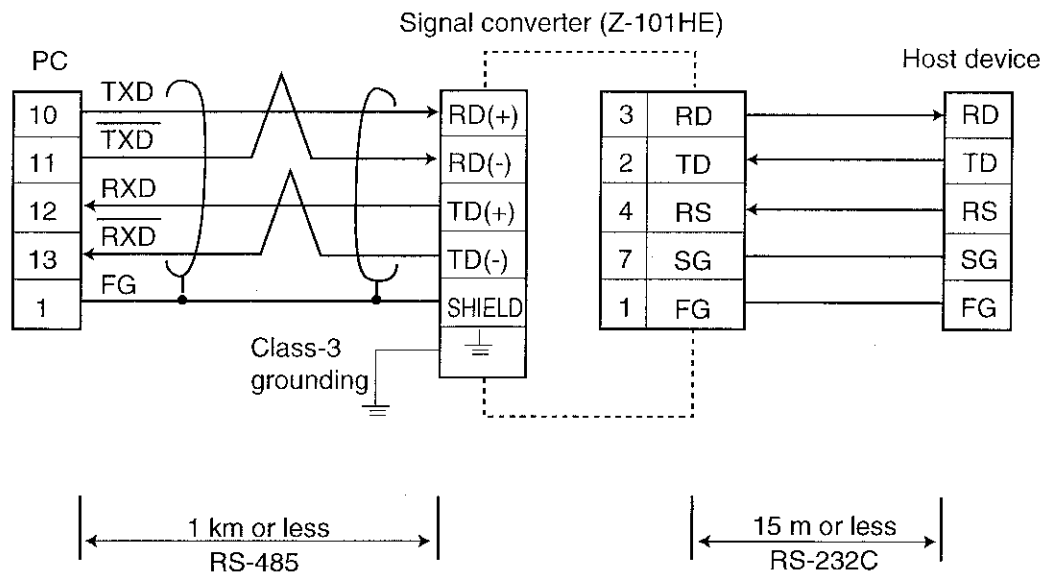

•When the total cable length is less than 15m:

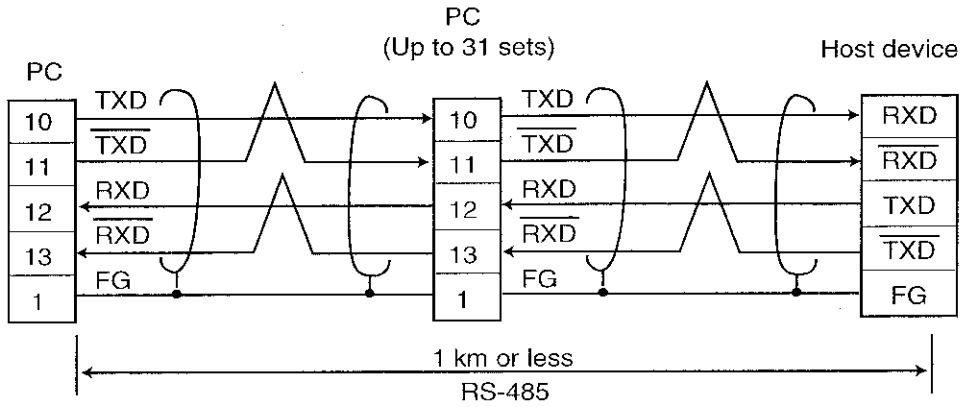

Recommended cable :

Fujikura cable 7P×7/0.18
57VV-SB vinyl-insulated, multicore cable

•When the total cable length exceeds 15m:

(3) In case that target station is RS-485

Recommended cable :
Hitachi cable CO-SPEV-SB0.5

Note 1: The Z-101HE signal converts RS-232C/RS-422 compatible signals transferred from the host device into RS-485 compatible signals with high noise immunity.

Note 2: The RS-485 standard was set forth by EIA in April 1983 as an enhancement of the RS-422 standard. The conventional computer link, data link, and remote I/O modules also conform to the RS-485 standard.

[6] Preparing the cable

Before soldering the serial communication cable to the plug pins, prepare it as described below:

[7] 15-pin Dsub connector

The serial communication port uses a 15-pin Dsub connector. The mating cable plug is supplied with the JW-70CU/100CU, JW-70CUH/100CUH control module.

[8] Soldering and assembly

Chapter 5. Installation

5-1 Precautions in installation

The JW50H/70H/100H is not designed for dust and water proof construction. Therefore, install JW50H/70H/100H in an enclosed panel.

Avoid keeping the JW50H/70H/100H in the following conditions:

1. Ambient temperature extremes outside the range of 0 to 55 °C
2. The relative humidity exceeding the range of 35 to 90%
3. Sudden temperature changes which may cause condensation.
4. Corrosive and flammable gases.
5. Water, oil and organic solvents dripping positions.
6. Dusts, iron and salty conditions.
7. A box in which high voltage device is installed.
8. Strong vibration and shock may usually occur.

Install on a good conductivity metal plated panel instead of painted one for easy grounding and better noise tolerance.

Use zinc plated retention screws of M5 for installing JW30H.

Calculation the average consumption electric power (heating value) of JW30H.

Determine the average power consumption of the entire machine in the following formula, and calculate the temperature rise in the panel.

- 1) Power supply module

$$W_{pw} = \frac{3}{7} \times (I_{5v} \times 5)(W)$$

I_{5v} : Current consumption of 5 VDC circuit of respective module

- 2) Total consumption electric power of respective module (5 VDC)

$$W_{5v} = I_{5v} \times 5(W)$$

- 3) Average consumption electric power of total 24 VDC power supply of output module (power consumption for simultaneous ON points)

$$W_{24v} = I_{24v} \times 24(W)$$

- 4) Average power consumption by output port drop voltage of output module (power consumption for simultaneous ON points)

$$W_{our} = I_{our} \times V_{drop} \times \text{No. of output points} \times \text{Simultaneous ON rate}(W)$$

I_{our} : Output current (current of use)(A)

V_{drop} : Drop voltage of respective output module(V)

- 5) Input port average power consumption of input module (power consumption for simultaneous ON points)

- In case of DC input

$$W_{IN} = I_{IN} \times E \times \text{No. of input points} \times \text{Simultaneous ON rate}(W)$$

- In case of AC input

$$W_{IN} = 0.1 \times I_{IN} \times E \times \text{No. of input points} \times \text{Simultaneous ON rate}(W)$$

I_{IN} = Input current (Rms value in the case of AC)(A)

E = Input voltage (voltage of use)(V)

- 6) Consumption electric power of special function module

$$W_s = I_{5v} \times 5 + I_{24v} \times 24 (W)$$

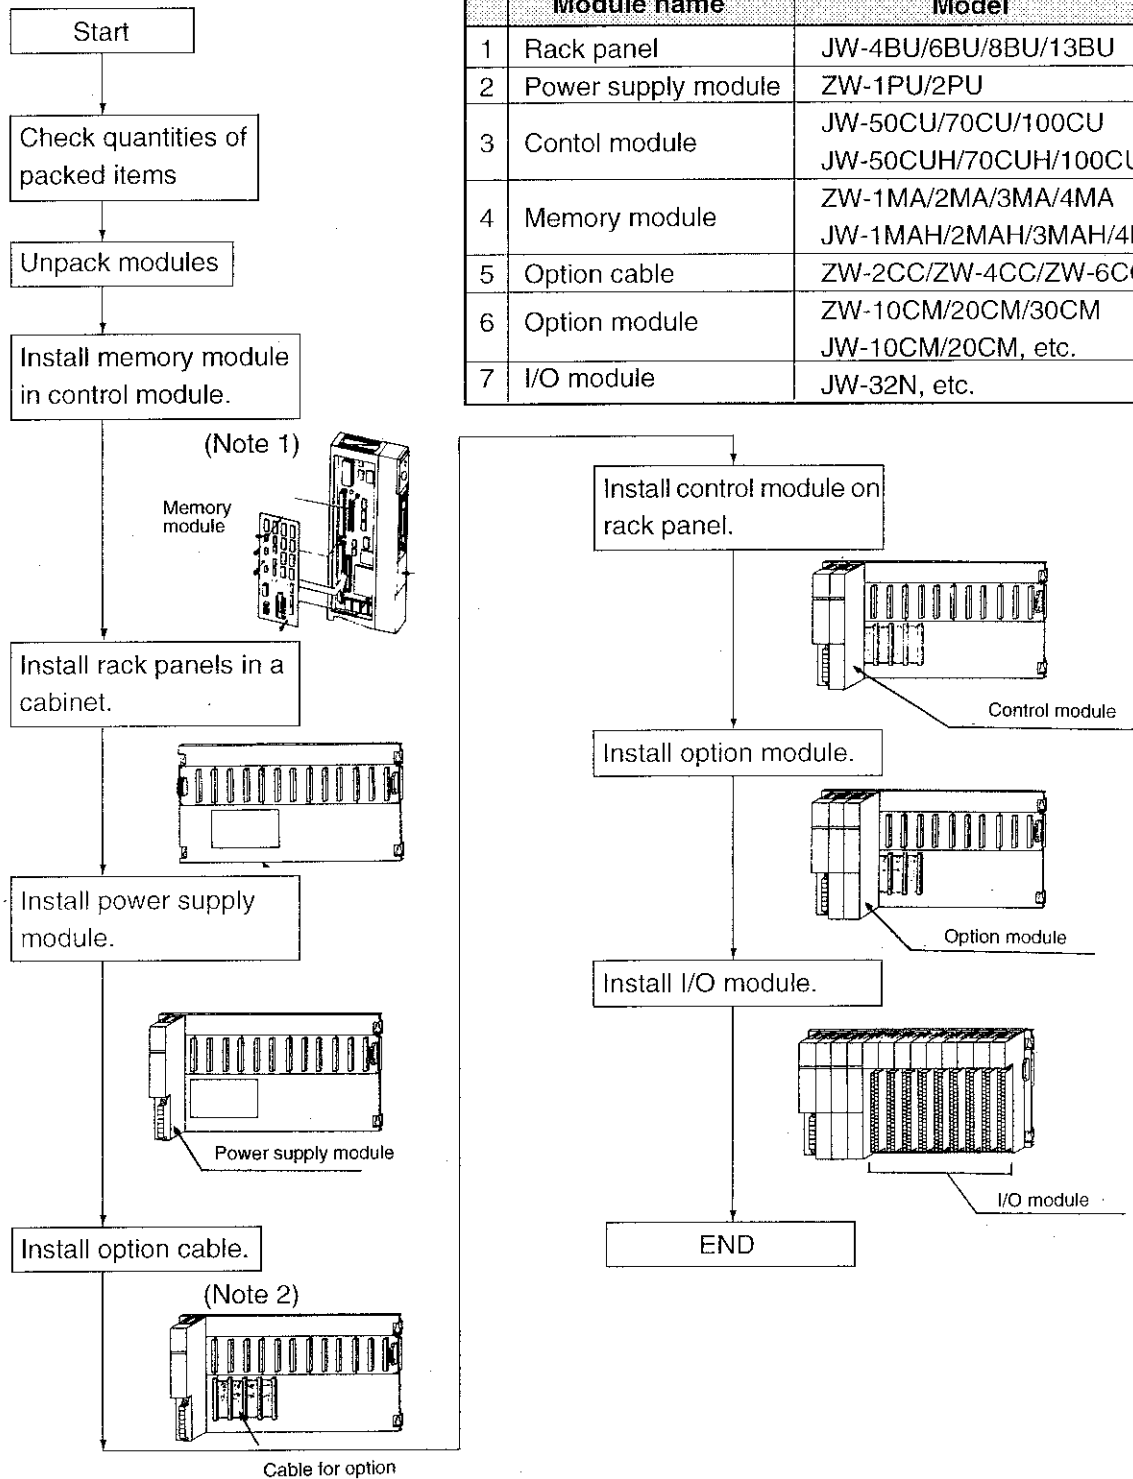

The total of the power consumptions calculated in each module is the power consumption of the entire machine. From this entire power consumption (W), calculate the heat generation and temperature rise in the panel.

5-2 Installation procedures

The JW50/70/100, JW50H/70H/100H programmable controller usually comprises many modules. This section describes the installation procedures, from module unpacking through rack panel mounting in a cabinet.

[Example of basic system configuration]

	Module name	Model
1	Rack panel	JW-4BU/6BU/8BU/13BU
2	Power supply module	ZW-1PU/2PU
3	Control module	JW-50CU/70CU/100CU JW-50CUH/70CUH/100CUH
4	Memory module	ZW-1MA/2MA/3MA/4MA JW-1MAH/2MAH/3MAH/4MAH
5	Option cable	ZW-2CC/ZW-4CC/ZW-6CC
6	Option module	ZW-10CM/20CM/30CM JW-10CM/20CM, etc.
7	I/O module	JW-32N, etc.

Note 1: The JW-50CU, JW-50CUH doesn't require memory module installation as it already contains one as a standard feature.

Note 2: Not needed for a stand-alone system.

Note 3: For the details on how to install each module, see the descriptions in later sections.

5-3 Mounting rack panels inside a cabinet

Note 1: The example above shows JW-13BU mounted in a cabinet.

Note 2: To secure adequate ventilation and make module mounting/removal and cabling easy, allow vertical spacing of 50 to 150mm between rack panels. A space of less than 50mm may cause an abnormal temperature rise within modules.

Note 3: Allow a space of more than 50mm on the left-hand side of the basic rack panel.

•Do not install the rack panels in the orientations shown below, as this will cause an usual temperature rise within the system :

Installation with vertical side facing upward (no good)

Installation with horizontal side facing upward (no good)

•When installing rack panels side-by-side, allow a space of 50 to 100 mm between them.

(Unit : mm)

ZW-46KB mounting hole location

ZW-102ZB mounting hole location

ZW-104ZB mounting hole location

ZW-08BU mounting hole location

M5-16 tapped hole
 Rack panel mounting hole location with board-to board spacing set to 100mm.

5-4 Installation of power supply module

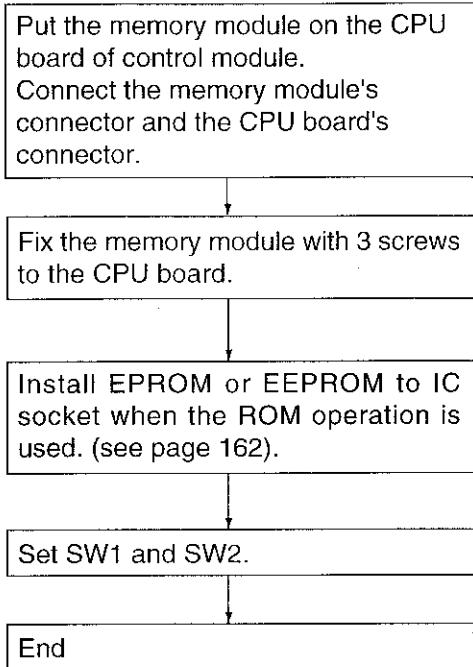

- 1) Plug the power supply module's output connector plug into the left end connector on the rack panel.
- 2) Secure the two rack panel retention screws of power supply module into module retention screw hole of rack panel using a phillips screwdriver.

5-5 Installation of memory module

This is the way to install the memory module on the control module (JW-70CU/100CU, JW-70CUH/100H).

[1] Installation of memory module (ZW-1MA/ZW-2MA/ZW-3MA)

SW1: Set the type of ROM

Setting	ROM model name
EEPROM	AT28C64B-15PC (made by ATMEL, available for only B version)
	AT28C256-15PC (made by ATMEL)
EPROM	27C512(Fuitsu)

SW2: Select ROM/RAM operation

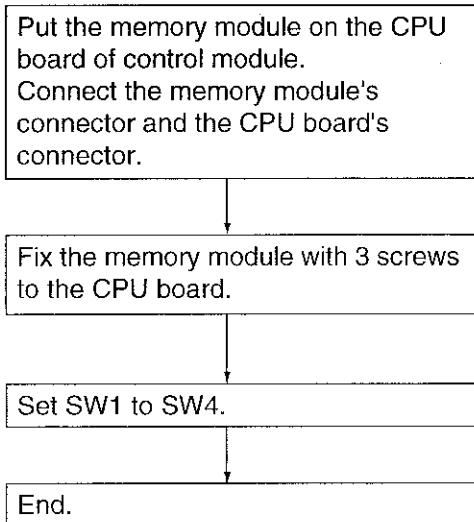

Setting	Contents
ROM	Setting at ROM operation.
RAM	Setting at RAM operation.(normal operation). Note 1

Note 1: ROM operation is only available when SW2 is set for ROM operation and the ROM chip is installed.

Note 2: Be sure to install the memory back-up battery on the RAM operation, otherwise, all program will be cleared when the power is OFF.

Note 3: ZW-1MA/2MA/3MA can be installed on the control module (JW-70CUH/100CUH), but processing speed is same as normal level.(See page 4-20.)

[2] Installation of memory module (ZW-4MA)

Setting of SW1 to SW4

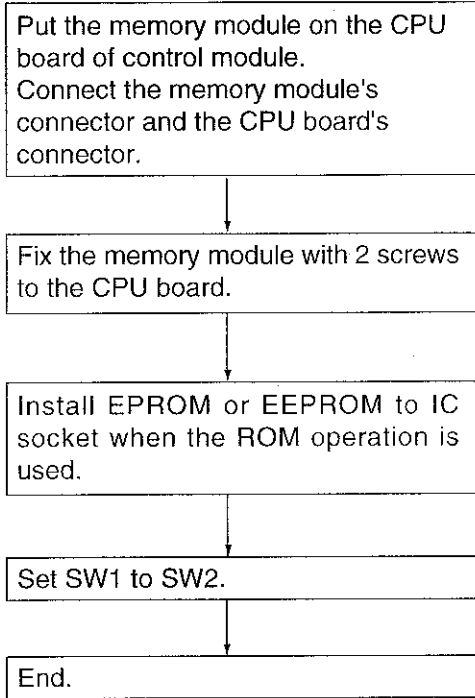

SW No.	Contents	ON	OFF
1	Switch file #4 and #C	#4	#C
2	Switch file #5 and #D	#5	#D
3	Switch file #6 and #E	#6	#E
4	File #7 is used or not	Used	Not used
5	Vacant		

Note 1 : Be sure to install the memory back-up battery when ZW-4MA is used.

Note 2 : Clear the memory area by using support tools after the installing the memory module. Refer to each manuals of support tools for details.

Note 3 : The ZW-4MA can be installed on the control module (JW-70CUH/100CUH), but processing speed is same as normal level. (See page 4-20.)

[3] Installation of memory module (JW-1MAH/3MAH)

SW2 : Set the type of ROM

Setting	ROM model name
EEPROM	AT28C64B-15PC (made by ATMEL, available for only B version) AT28C256-15PC (made by ATMEL)
○EPROM	27C512(Fuitsu)

SW1: Select ROM/RAM operation and normal/high speed

Setting		Contents
SW1-1	○RAM	Setting at RAM operation
	ROM	Setting at ROM operation Note 1
SW1-2	L	Normal speed Note 2
	○H	High speed Note 2

Note 1: ROM operation is only available when SW1-1 is set for ROM operation and the ROM chip is installed. Be sure to install the memory back-up battery on the RAM operation, otherwise, all program will be cleared when the power is OFF.

Note 2: Refer to the programming manual "Chapter 3. Description of instructions" to confirm the each processing time. (Normal/high speed).

- Processing time of normal speed operation → Processing time of JW50/70/100.
 - Processing time of high speed operation → Processing time of JW50H/70H/100H.
- (When the JW-1MAH/3MAH is installed on the JW-70CU/100CU,

[4] Installation of memory module (JW-2MAH)

- Put the memory module on the CPU board of control module.
Connect the memory module's connector and the CPU board's connector.
- Fix the memory module with 3 screws to the CPU board.
- Install EPROM or EEPROM to IC socket when the ROM operation is used.
- Set SW2 to SW3.
- End.

(○ mark : Setting at delivery)

SW3 : Set the type of ROM

Setting	ROM model name
EEPROM	AT28C64B-15PC (made by ATMEL, available for only B version) AT28C256-15PC (made by ATMEL)
○EPROM	27C512(Fuitsu)

SW2: Select ROM/RAM operation and normal/high speed

Setting	Contents
SW1-1	○RAM Setting at RAM operation
	ROM Setting at ROM operation Note 1
SW1-2	L Normal speed Note 2
	○ H High speed Note 2

Note 1: ROM operation is only available when SW2-1 is set for ROM operation and the ROM chip is installed. Be sure to install the memory back-up battery on the RAM operation, otherwise, all program will be cleared when the power is OFF.

Note 2: Refer to the programming manual "Chapter 3. Description of instructions" to confirm the each processing time. (Normal/high speed).

•Processing time of normal speed operation → Processing time of JW50/70/100.

•Processing time of high speed operation → Processing time of JW50H/70H/100H.

(When the JW-2MAH is installed on the JW-70CU/100CU,

[5] Installation of memory module (JW-4MAH)

- Put the memory module on the CPU board of control module.
Connect the memory module's connector and the CPU board's connector.
- Fix the memory module with 3 screws to the CPU board.
- Set SW1 and SW2.
- End

SW1: Select the file memory

Setting	Contents	OFF	ON
SW1-1	File #7 is used or not	Unused	Used
SW1-2	Switch file #6 and #E	#E	#6

SW2: Select normal/high speed

Setting	Contents
SW2-1	<input type="radio"/> RAM
	<input type="radio"/> ROM
SW2-2	L
	<input type="radio"/> H

Note 1: Be sure to install the memory back-up when JW-4MAH is used.

Note 2: Clear the memory area by using support tools after the installing the memory module (JW-4MAH). Refer to each manuals of support tools for details.

Note 3: Refer to the programming manual "Chapter 3. Description of instructions" to confirm the each processing time. (Normal/high speed).

- Processing time of normal speed operation → Processing time of JW50/70/100.

- Processing time of high speed operation → Processing time of JW50H/70H/100H.

(When the JW-4MAH is installed on the JW-70CU/100CU,

5-6 Installing the control module

- 1) Plug the control module's connector into the mating socket next to the left end socket on the basic rack panel.
- 2) Secure the two rack panel retention screws of control module into module retention screw hole of rack panel using a philips screwdriver.

Note 1: When using an option module, install the option cable on the basic rack panel before installing the control module. When installing the option cable, ensure the correct connector orientation.

Note 2: Be sure to install the control module right next to the power supply module.

Note 3: Bend the option ribbon cable toward the basic rack panel.

5-7 Installation of I/O modules

[1] Installing JW-series I/O modules

The JW-series I/O modules can be installed on any of the following types of rack panels:

Model name	Model	Remarks
Rack panel	JW-13BU	Accommodates up to 13 JW I/O modules.
	JW-8BU	Accommodates up to 8 JW I/O modules.
	JW-6BU	Accommodates up to 6 JW I/O modules.
	JW-4BU	Accommodates up to 4 JW I/O modules.

- 1) Plug the I/O module's connector into the mating socket on the rack panel.
- 2) Secure the two rack panel retention screws of I/O module into module retention screw hole of rack panel using a philips screwdriver.

Note 1: Whenever installing or removing an I/O module, be sure to turn off the power supply to the rack panel or enter the "Live I/O replace" mode.

Note 2: Do not install a contact output module (JW-34S, etc.) next to an option module as voltage spikes from relay contacts may cause the option module to malfunction.

Note 3: No I/O modules can be installed in positions where the option cable (ZW-2CC/4CC/6CC) is already installed.

[2] Installing ZW-series I/O modules

The ZW-series I/O modules can be installed on any of the following types of rack panels:

Model name	Model	Remarks
Rack panel	ZW-08BU	Accommodates up to 8 ZW I/O modules.
Basic rack panel	ZW-28KB	Accommodates up to 8 ZW I/O modules.
	ZW-46KB	Accommodates up to 6 ZW I/O modules.
	ZW-04KB	Accommodates up to 4 ZW I/O modules.
	ZW-02KB	Accommodates up to 2 ZW I/O modules.
Expansion rack panel	ZW-108ZB	Accommodates up to 8 ZW I/O modules.
	ZW-104ZB	Accommodates up to 4 ZW I/O modules.
	ZW-102ZB	Accommodates up to 2 ZW I/O modules.
	ZW-508ZB	Accommodates up to 8 ZW I/O modules.

- 1) Remove the front access cover from the I/O module to be installed (insert your finger into the cover's top opening and pull the cover forward).
- 2) Insert the guide pins at the back of the I/O module into the mating guide holes in the rack panel, then push in the module until its connector is firmly plugged into the mating socket.
- 3) Secure the module to the rack panel with the top and bottom module retention screws.
- 4) Connect the cable wires from an external I/O device to the terminal block (terminal type), or to the I/O connector (connector type).
- 5) Replace the front access cover, with the cables from the terminal block passing through the bottom opening of the cover (terminal block type).

Note 1: Whenever installing or removing an I/O module, be sure to turn off the power supply to the control module or the expansion rack panel on which the I/O module is installed.

Note 2: Do not install a contact output module (ZW-16S4/16S4D/32S4T, etc.) next to an option module as voltages spikes from relay contacts may cause the option module to malfunction.

5-8 Installing the side panel on an I/O module

[1] Installing the side panel on a JW-series I/O module

[2] Installing the side panel on a ZW-series I/O module

The side panel to be installed on the left side of the left end I/O module on an expansion rack panel is supplied with the expansion rack panel.

- Apply a torque of less than 0.49N•m to the tapping screws.

5-9 Installing the expansion power supply module (for ZW-I/Os)

- 1) Loosen the cover retention screw ④ with a Philips screwdriver and remove the cover ③ from the expansion power supply module.
- 2) Insert the four guide pins at the back of the module into the mating guide pin holes ① in the expansion rack panel (ZW-108ZB, etc.) then push in the module until its connector is firmly plugged into the mating socket.
- 3) Secure the two rack panel retention screws of expansion power supply module into module retention screw hole of rack panel using a philips screwdriver.

Note 1: The expansion power supply module cannot be installed on the JW-4BU/6BU/8BU/13BU rack panels, ZW-28KB/46KB basic rack panels, or ZW-508ZB expansion rack panel.

Chapter 6. Wiring

6-1 Precaution for wiring

Follow the below instructions for wiring:

- 1) Separate power line and I/O lines of the JW50H/70H/100H from high voltage lines and power lines as far as possible. Do not run power lines and I/O lines in parallel with high voltage or power lines.
- 2) For the I/O expansion cable and wiring the 5 VDC cable, use supplied accessories for the I/O expansion cable.
- 3) Do not install the I/O expansion signal cables and 5 VDC power cables (Note 1)
- 4) Don't run the I/O expansion cable and the 5 VDC cable inside a duct.
- 5) Cables connected to I/O modules should be routed in such a manner that the indicator lights on the modules are not hidden.
- 6) Use twisted cables of over KIV 1.25 square for connection to the primary power input terminal of the power supply module.
- 7) Use cables of over KIV 0.5 square for wiring from the relay terminal block of the control panel to the input module.
- 8) Use wires with KIV 0.75 or larger gauge for the wiring from the cabinet's bulkhead terminal block to the output modules that drive high-power loads such as solenoids. Use wires with KIV 0.5 or large gauge for lighter loads.
- 9) Use wires of over KIV 1.25 square for wiring from the relay terminal block to input/output equipment.
- 10) When the whole factory site is grounded for high electricity and not suitable for the grounding of the JW50H/70H/100H, connect the GND terminal of the JW50H/70H/100H with just the board ground.(See the next page.)
- 11) Use crimp-type terminals for all connections to the PC's terminal blocks. For suitable sizes of crimp-style terminals, see the following table.

		Dimension A(mm)	Spacs. of screw B
JW-series I/O modules		7.3	M3.5×7 self-locking screw
ZW-series I/O modules	8/16-point modules	7.7	M3.5×8 self-locking screw
	32-point modules	7.5	M3.5×8 self-locking screw
Power supply module		7.4	M3.5×6 self-locking screw
Basic rack panel		8.5	M3.5×8 self-locking screw
Rack panel		8	M3.5×8 self-locking screw
Expansion rack panel		8	M3.5×8 self-locking screw
Expansion power supply module		7.3	M3.5×8 self-locking screw

12) Wiring with noise countermeasures

Malfunctions are often caused by noise interference. This paragraph describes how to improve the system's immunity to noise interface and to prevent possible malfunctions resulting from them. Malfunctions due to noise could result from more than one cause or from a cause which cannot be analyzed in quantitative terms. Attempt appropriate field actions case-by-case by referring to the following typical countermeasures:

(1) Grounding

Grounding has two purposes; to protect operators from electric shock and to prevent malfunction by noise. The grounding for noise prevention is shown here.

1) Don't use a common ground for the JW50H/70H/100H and other device.

When the GND cable of the JW50H/70H/100H is also used for grounding for other device, noise might come into the JW50H/70H/100H from other device.

Bad example: Don't use the GND line of the JW50H/70H/100H for grounding of a motor or an inverter.

Countermeasure 1: Separate grounding for each of the PC, the motor and the inverter.

Note 1: Use a twisted wire of over 2 mm² sectional area and less than 5m long in grounding the PC for the noise prevention purpose.

Note 2: If sharing a single ground wire with an inverter cannot be avoided, use separate ground wires to the grounding points as shown:

Countermeasure 2: When a separate ground point is not available for the PC :

Connect the PC's grounding post directly to the cabinet chassis on which the basic rack panel is mounted.

Note 1: When grounding the PC directly to the cabinet chassis, note the following points :

- Use the minimum length of wire of necessary to connect the power supply module's grounding post to the rack panel mounting screw. The same wiring manner should be used for the expansion rack panel.

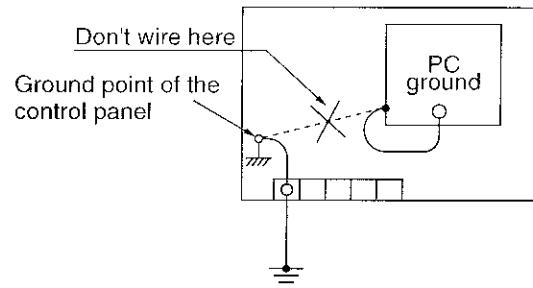

Drop the grounding cable into the fastening screw on the basic rack panel.

- Install firmly the basic rack panel and the expansion rack panel on the chassis of the control panel and make sure of the electric conductivity.

- Where the control panel itself is grounded, do not wire between the grounding point and the GND terminal of the JW50H/70H/100H.

Reference: Note for fitting the JW50H/70H/100H on the control panel door.

- Ground from the GND terminal of the JW50H/70H/100H to the door.
- Use a twisted wire of over 2 mm² sectional area for grounding cable of the control panel from its door (less than 50 cm.)

(2) Countermeasure of noise from power supply line

The AC power supply input noise resistance capacity of the JW50H/70H/100H is 1000 Vp-p. When any noise over this limit is possible to come through the power supply line, install an insulation transformer.

Countermeasure: Install an insulation transformer
 Noise has a high frequency of 100 KHz to 2 MHz, which should be blocked by a transformer.

Note 1: When using an insulation transformer, note the following points:

- An insulation transformer with static electricity shield can also prevent noise by static coupling.
- Install an insulation transformer near the power supply input of the control panel in order to block noise at the entrance of the control panel.

- Use two twisted wires in the primary and secondary sides of the transformer.
- Choose the insulation transformer of the capacity of more than 20% higher than that of the rated load. When a transformer of the same capacity as that of the rated load is used, a primary input voltage might exceed the transformer rated capacity and become dangerous state such as emitting smoke.
- When a large-capacity transformer with higher voltage in the secondary side is chosen, we recommend to install an intermediate voltage tap.

- With particularly large noise, several transformers can be installed, not only to the power supply input of the JW50H/70H/100H but also to the load and AC input.

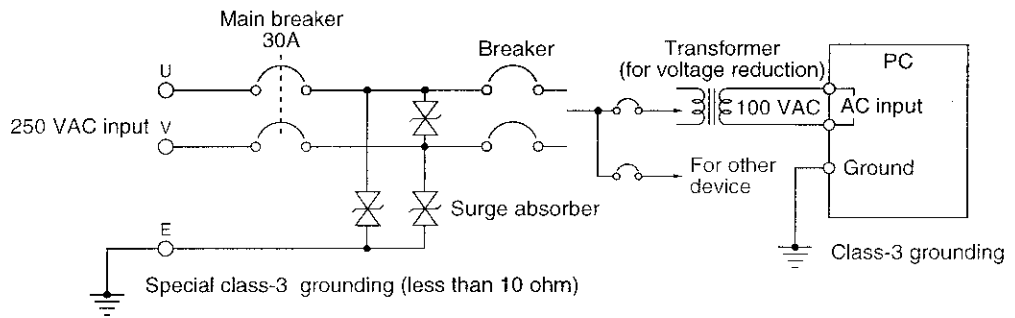

(3) Safeguard from lightning

Below are countermeasures in case when the factory facilities are located far from residential areas and that effects from induced lightning (induced voltage by lightning strikes) are expected. Note, however, that they are not the measures for direct strikes of lightning. In some cases, the voltage of the induced lightning may go beyond 4000 KV. Therefore, the purpose of these countermeasure is just to minimize the damage on the device.

Countermeasure 1: Install a surge absorber on the receiver panel of commercial electric power as protection from induced lightning.

Different models should be chosen according to the facilities load and power supply voltage. For your reference, below is a wiring diagram of the outdoor type cubicle for 1.7 KVA.

Note: Note the following when wiring.

- The ground of the surge absorber is the special class-3 ground (less than 10 ohm ground resistance) and should be separated from the ground of the JW50H/70H/100H. (Class-3 grounding.)
- Install the main breaker before the surge absorber.
- The followings are known surge absorbers in the market. Different types for different power supply voltages.

Commercial power voltage	Model name	Specifications	Manufacturer
100 VAC	ERZ-A20PK251	Varistor voltage: 250V ± 10% Surge resistant volume: 1,500A (8 × 20μs) Energy resistant volume: 15 Joule	Matsushita Electric Co.,Ltd.
200 VAC	ERZ-A20PK501	Varistor voltage: 500V ± 10% Surge resistant volume: 1,500A (8 × 20μs) Energy resistant volume: 70 Joule	

- Use the ground wire of over 3.5mm² section area for the surge absorber.

Countermeasure 2: Underground wiring as a countermeasure of lightning.

When communication cables and input cables of the JW50H/70H/100H go out of a building, place them underground. Provide junction for input/output signals using relays.

1. Underground cabling

In a lightning weather condition, the atmosphere is electrically charged and a wiring in the air induces a voltage of over 24 VDC. Therefore, place the wiring under the ground.

As for the depth of cable installation, refer to local regulations.

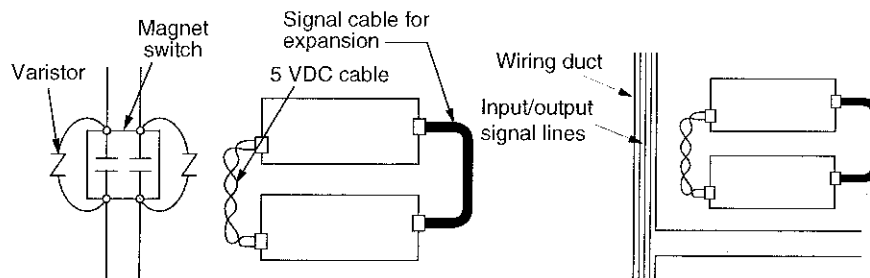

2. Relay connection for the input/output signals using relays.

The relay isolates the effects of lightning and minimizes the damage.

(4) Wire of signal cable for expansion

When turning ON/OFF of the magnet switch installed near the JW50H/70H/100H and the signal cable for expansion, high noise and high voltage may occur to give bad effects on the operation of the JW50H/70H/100H. Therefore, for prevention of the noise occurrence, insert a noise killer, such as a varistor, at the contact point of the magnet switch. Do not place the signal cable for expansion and the 5 VDC cable inside the duct, through which input/output signal lines and power lines are running.

(5) Precautions for input/output signal wiring

1. Relay output module installation

If a relay output module is used to switch heavy loads, switching transients can have undesirable effects on the operation of the CPU board, option module, and/or special modules. To avoid this, do not install the relay output module next to these modules.

Example for JW50/70/100, JW50H/70H/100H
(ZW-28KB)

Note : When a relay output module is loaded with inductive loads, use a varistor or C/R filter across each set of relay contacts to absorb transients (see page 73.)

2. DC input module

When extending the external line of the DC input module for more than 100 m, use shielding wire. Even in case of less than 100 m extension, shielding wires should be used under certain conditions. Do not forget to connect the shield of the shielding wire with the ground of the JW50H/70H/100H.

Note : The outer shield conductor may be grounded at either or both ends depending on the situation.

3. AC input module

Do not use the outputs from a constant voltage transformer and an AC regulator, for the AC power supply to the AC input module. When the constant voltage transformer and the AC regulator are used, the module signal could be turned ON even with an input voltage less than the rate voltage due to a high distortion rate (10 to 50%) of alternative current waves. The power supply to the AC input module should have a distortion rate of less than 5%.

4. Wiring with power line

Do not run the input signal, output signal and communication cables of the JW50H/70H/100H near and in parallel with the power line.

- When input and output signal cables are extended over 100 m, make separate wiring for the input signal and the output signal of JW50H/70H/100H.

- Make separate wiring for the input signal and the output signal of the JW50H/70H/100H from the power line. Particularly with the power line for the inverter and the servo driver, do not place signal wires inside the same duct or pipe with the power line, even if they are less than 100 m.

6-2 Wiring for JW-1PU power supply module

Open the terminal cover and connect the cables to the terminal block as shown :

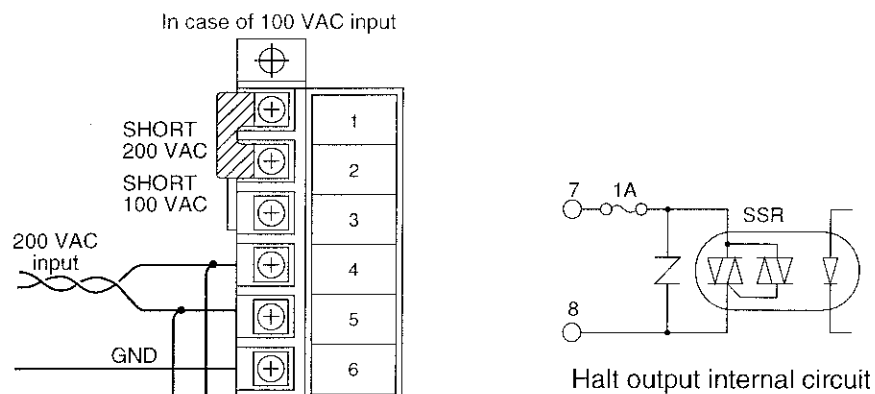

- When a DC output module is used, connect an AC relay coil to the halt output terminals and insert the relay contacts into emergency stop circuit.

Note 1: Apply a torque of 1.18N•m or less to the terminal screws.

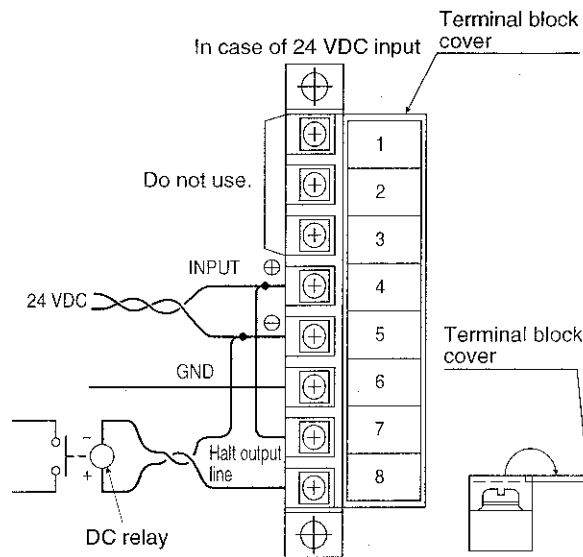

Note 2: Up to three halt output circuits can be connected in series. For more circuits, use an intermediate relay.

Note 3: For a line voltage of 200 VAC, the metal short on the terminal block must be placed in the 200 VAC position. If 200 VAC power is applied with the line voltage selection left at 100 VAC, the power supply module will sustain permanent damage.

6-3 Wiring for JW-2PU power supply module

Open the terminal cover and connect the cables to the terminal block as shown :

The coil rating must conform to the power supply voltage.

- Connect a DC relay coil to the halt output terminals and insert the relay contacts into the emergency stop circuit.

Note 1: Apply a torque of 1.18N•m or less to the terminal screws.

Note 2: More than one halt output circuit cannot be connected in series. For serial connections, use relays.

Note 3: Make sure that the input power and halt output are connected with the correct polarity. Cross connection will result in permanent damage to the power supply module.

Halt output internal circuit

6-4 Wiring for ZW-100PU1/100PU2 expansion power supply module

Open the terminal cover and connect the cables to the terminal block as shown :

Note 1: Apply a torque of 1.18N•m or less to the terminal screws.

Note 2: Up to three halt output circuits can be connected in series. For more circuits, use an intermediate relay.

Note 3: For a line voltage of 200 VAC, the supply voltage selector switch on the expansion power supply module must be set to the 200 VAC position (see page 4-83).

6-5 Wiring for expansion rack panel

When one or more expansion rack panels are to be used, interconnect them and the basic rack panel as shown below, using the I/O expansion signal and 5V power cables supplied with each rack panel. When connecting cables, pay special attention to the discrimination between the IN and OUT ports of the I/O expansion connectors.

When installing expansion rack panels side-by-side, use the ZW-1KC I/O expansion signal cables. For connection to the ZW-10EU I/O expansion module, see the description in section 4-10-1.

Note 1: Use wires with a thickness of KIV 1.25 or more for the I/O expansion 5V power cables.

•Connecting the I/O expansion signal cable

The I/O expansion signal cable plug has a reverse insertion prevention key. After plugging the cable into its socket, lock it with the side locks.

Note 1: Do not tie the I/O expansion signal and 5V power cables with the PC's input/output signal cables or power cables, nor install one in the duct or conduit where the other is installed.

6-6 Wiring for input and output modules

[1] Terminal block type

Use a crimp-style terminal for every connection of external devices, such as limit switches and solenoids, to input/output modules.

	JW series	ZW series	Crimp-style terminal models
	$B < 7.2$ $d2 > 3.5$	$B < 7.4$ $d2 > 3.5$	1.25-YS3A 2-YS3A V1.25-YS3A V2-YS3A
			1.25-3.7 2-S3 V1.25-3.7 V2-S3

After typing all wires to the terminal block, pass the wire harness through the slot between the terminal block and the I/O module's terminal block on the left.

The terminal block can be detached from the I/O module with the cable wires connected.

[2] Connector type description

- 1) Address number assignments are not identical to pin number assignments. Assemble the plug with special attention paid to the address number assignments.
- 2) Cover every soldered wire end with an insulating sleeve.
- 3) Use a screwdriver to secure the cable plug to the mating receptacle on the module.

Recommended cable: Fujikura Electrical Wire Co.

18 × 7/0.18 57VV-SB (Multicore vinyl-insulated, vinyl-sheathed cable)

Note 1: If it is expected that a large current returns from an output module through the common line, use a thicker wire.

6-7 Wiring for 24 VDC terminal block on rack panel (for ZW-8S2/16S2/16S4)

When a DC output module (ZW-8S2, etc.) or contact output module (ZW-16S4, etc.) is used to drive DC loads, an external supply of 24 VDC must be supplied to the 24 VDC terminal block on the standard of expansion rack panel on which the module is installed.

[1] Driving a 12 or 24 VDC load from a DC output module

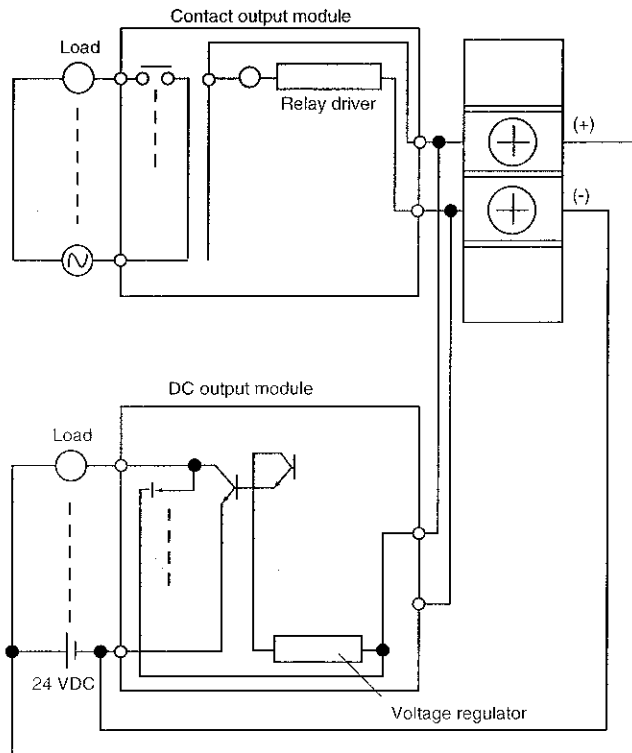

- When driving a 12 VDC load from a DC output module, the external power supplied to the 24 VDC terminal block on the rack panel must have a voltage equal to or higher than that of the load power supply.

[2] Driving a load from a contact output module

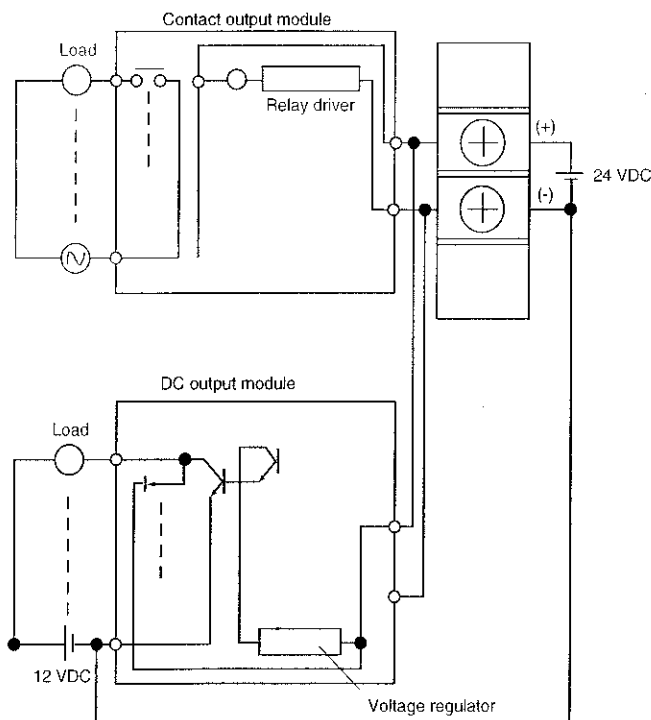

- Use a DC power source separate from the load power supply and connect it to the 24 VDC terminal block on the expansion rack panel.

[3] Using both DC and contact output modules on the same rack panel

- When driving a 24 VDC load from a DC output module, connect the positive and negative terminals of the 24 VDC load power supply to the corresponding terminals of the 24 VDC terminal block on the basic or expansion rack panel.

- When driving a 12 VDC load from a DC output module, connect a separate 24 VDC power source to the 24 VDC terminal block on the basic or expansion rack panel, with its negative terminal connected to the appropriate terminal of the load power supply. The 24 VDC power is required to drive the contact output module's relay coils.

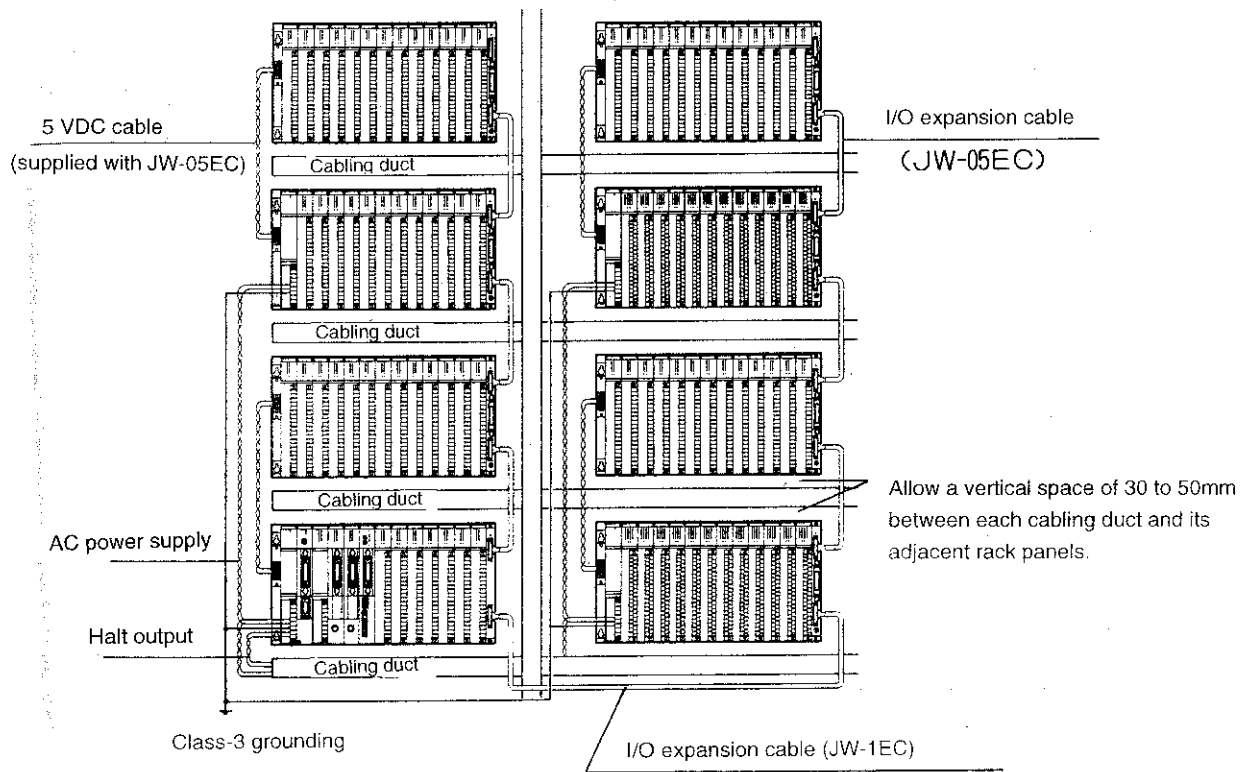

Note 1: Apply a torque of 1.18N•m or less to the terminal screws.

Note 2: When using an external source separate from the load power supply, observe the precautions given in page 4-64.

6-8 Intercabinet cable routing examples

[1] Example for use JW-series I/O modules (1)

The system given in this example consists of eight rack panels holding JW-series I/O modules and an I/O bus extension adapter:

Note 1: Use the same AC line power source for all rack panels.

Note 2: DC and contact output modules require a 24 VDC power source which is separate from the load power supply.

Note 3: Do not install expansion signal cables or I/O expansion 5VDC power cables in the same duct or conduct in which the PC's I/O signal cables or power cables are installed.

Note 4: For ZW-series I/O module, do not connect more than three halt output circuits in series. If more than three circuits must be connected in series as expansion power supply module operations are monitored by the control module through the I/O expansion cables. Use only the halt output of the power supply module on the rack panel. (The halt outputs of the ZW-2PU power supply modules cannot be connected in series. Be sure to use intermediate relays.)

[2] Example for use JW-series I/O modules (2)

The system given in this example consists of two rack panels holding JW-series I/O modules and no I/O bus expansion adapter.

Note 1: An expansion power supply module can be installed on the expansion rack panel only if the I/O bus expansion adapter (JW-1EA/2EA) is used in the expansion port.

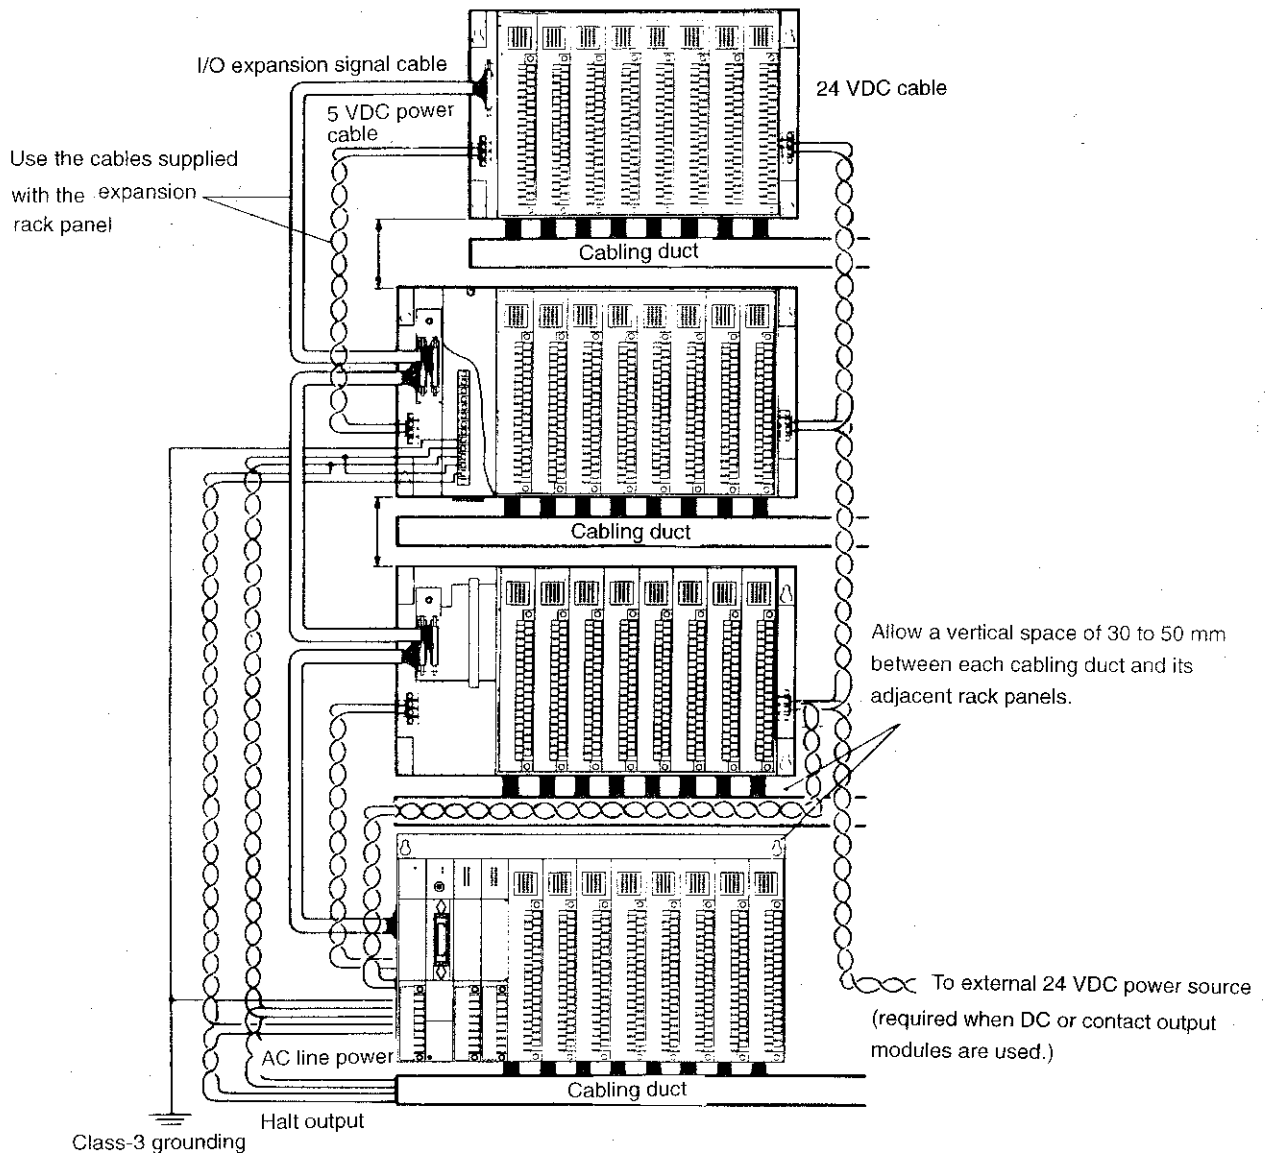

Note 2: Use a JW-05KC or JW-1KC I/O expansion cable to establish bus connection between the rack panels. If a cable length of more than 1 m is needed, you have to use an I/O bus expansion adapter (JW-1EA/2EA).

Note 3: DC and contact output modules require a 24 VDC power source which is separate from the load power supply.

Note 4: Do not install expansion signal cables or I/O expansion 5 VDC power cables in the same duct or conduct in which the PC's I/O signal cables or power driving lines are installed.

[3] Example for use ZW-series I/O modules

The system given in this example consists of four rack panels holding ZW-series I/O modules :

Note 1: The power module and expansion power supply module used in the system should be supplied from the same AC line power source.

Note 2: No more than three halt outputs can be connected in series. The ZW-2PU power supply module's halt output cannot be connected in series.

Note 3: When DC and/or contact output modules are to be used, prepare a 24 VDC power source which is separate from the load power supply.

Note 4: Do not install the I/O expansion signal cables and 5 VDC power cables in the same ducts or conduits where the PC's I/O signal cables or power cables are installed.

Note 5: When using the I/O expansion module, see page 4-93.

Chapter 7. ROM operation

This chapter describes how to implement a user program or data stored in ROM. ROM operation is possible when the JW-1MA/2MA/3MA, JW-1MAH/2MAH/3MAH memory module is installed in the control module. (Note 1)

7-1 What is ROM operation?

ROM operation runs the programmable controller using the program or data stored in ROM. At system power-on, the user program or part of the data stored in ROM is transferred to RAM, which is then used to run the system. Since the contents of ROM are left intact power-off, the same program or data can be used repeatedly until the ROM rewritten.

If 11_(H) is written to system memory location #0255 and ROM operation is executed on the JW50H/70H/100H, malfunctions can be prevented since :

- The program cannot be modified (only system memory can be modified).
- The contents of ROM are automatically transferred to RAM when they differ.

ROM operation is useful in the following cases:

- 1) If the PC is to be left unused for a relatively long interval. (Stored program remains intact even after backup battery is used up).
- 2) If you do not want to re-enter data, files, or programs.
- 3) If you wish access to a stored program more quickly (EEPROM allows quicker access than a floppy disk.)

There are 4 types of ROM operations depending on the set value in system memory #0255.

Item	ROM operation				See page
	00 _(H)	11 _(H) (Note 2)	22 _(H)	44 _(H)	
Set value in system memory #0255	00 _(H)	11 _(H) (Note 2)	22 _(H)	44 _(H)	161 164
ROM to RAM transfer	Manual transfer after PC is powered ON	Automatic transfer after PC is powered ON			—
PC mode when powered ON	Previous mode when last turned OFF		Halt mode	Operation mode	Programming manual
Data memory clear when powered ON	No		Yes		Programming manual
Operation with no battery	No		Yes		166
Operation with battery	Yes				
Type/mode of installed ROM	EPROM (27C512), EEPROM (AT28C64B-15PC, AT28C256-15PC)				160
ROM area	Set system memory #0256 according to the type/model of installed ROM.				

Note 1: ROM operation is not available when the ZW-4MA or JW-4MAH is used for the memory module.

Note 2: Value of 11_(H) can be set when JW50H/70H/100H is used but not when JW50/70/100 is used.

7-2 Preparing for ROM operation

[1] ROM types usable for ROM operation

ROM type	ROM model	Remarks
EPROM	27C512	(250 ns) Fujitsu
EEPROM	AT28C64B-15PC	(250 ns) ATMEL
	μ PD28C64C	(250 ns) NEC
	AT28C256-15PC	(250 ns) ATMEL

[2] ROM area

The address area and contents to be mapped onto ROM are defined by values stored in system memory address #0256:

*Unusable for except B version.

	Setting value		Contents to be mapped onto ROM				ROM type	ROM model	
	Octal	Hexa-decimal	System memory	User program	Register	File 1			
System memory address #0256	00 ^(s)	00 ^(h)	---	---	---	---	---	---	Note 1
	146 ^(s)	66 ^(h)	#0200 to #2177	3.5K words	---	---	EEPROM	AT28C64B-15PC (made by ATMEL)	
	167 ^(s)	77 ^(h)	#0200 to #2177	31.5K words	---	---	EPROM	27C512 (Fujitsu)	
	200 ^(s)	80 ^(h)	#0200 to #2177	15.5K words	---	---	EEPROM	AT28C64B-15PC (made by ATMEL)	
	201 ^(s)	81 ^(h)	#0200 to #2177	7.5K words	09000 to 09777 19000 to 19777	---			
	202 ^(s)	82 ^(h)	#0200 to #2177	7.5K words	---	16K bytes			
	203 ^(s)	83 ^(h)	#0200 to #2177	---	09000 to 09777 19000 to 19777	---			
		204 ^(s)	84 ^(h)	#0200 to #2177	---	---	31K bytes		

Note 1: The default value of system memory address #0256 is 00(H), which specifies RAM operation.

Note 2: Registers 29000 through E1777 cannot be mapped onto ROM.

[3] Type-independent ROM writing procedures

(1) EPROM (ROM model name : 27C512)

First transfer your program from the multipurpose programmer to the ROM programmer, then write the program into the EPROM chip set to the programmer. (See page 7-3).

Note 1: We recommend the following PROM programmer models :

Ando Electric Co. AF-9703
 Minato Electronics Co. MODEL-1866A
 Advantest Co. TR4943

Note 2: For operation of the multipurpose programmer and the PROM programmer, see the user's manual supplied with the device.

Note 3: Multipurpose programmers (JW-30PG/32PG) with software versions 1.0 and 1.0A have no capability to transfer programs to a PROM programmer. The software version can be checked on the main menu.

Software version with no ROM programmer transfer function: Ver 1.0, Ver 1.0A

(2) EEPROM (ROM model name: AT28C64B-15PC or AT28C256-15PC)

JW50/70/100, JW50H/70H/100H

Hand-held programmer

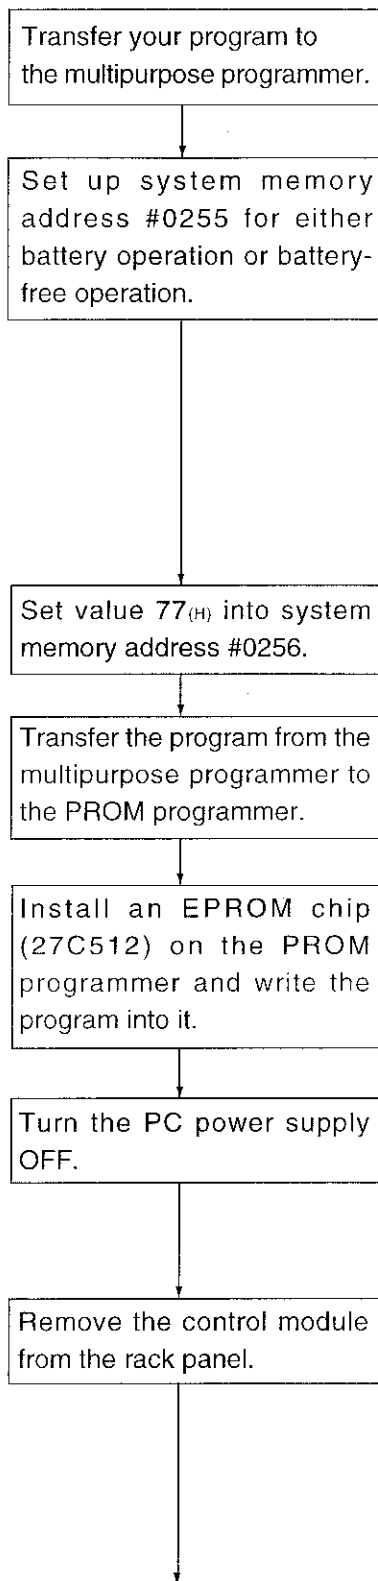

A program stored in RAM can be written into an EEPROM under control of the hand-held programmer. (See page 7-5 to 7-7.)

7-3 Writing a program into ROM

[1] Procedure when using EPROM

The following describes how to use an EPROM chip (ROM model name: 27C512):

*1 To next page

Multipurpose programmer
(JW-30PG/32PG/40PG/50PG
Above shown is JW-50PG.)

System memory	Octal	Hexa-decimal	Contents
#0255	000 ₍₈₎	00 _(H)	RAM operation (operation with battery)
	021 ₍₈₎	11 _(H)	ROM operation (previous mode when last turned OFF at power ON)
	042 ₍₈₎	22 _(H)	ROM operation (operation without battery, halt at power ON)
	104 ₍₈₎	44 _(H)	ROM operation (operation without battery, run at power ON)

Note 1: When the JW50/70/100 is used, value 11_(H) cannot be set to #0255. To execute ROM operation on the JW50/70/100 (with battery), set value 000_(octal) and then use the hand-held programmer to perform the ROM to RAM transfer.

System memory	Octal	Hexa-decimal	Contents
#0256	167 ₍₈₎	77 _(H)	Sets up ROM type for an EPROM (27C512)

Note 1: When using an EPROM, do not set system memory #0256 to any value other than 77_(H).

Multipurpose programmer
(JW-30PG/32PG/40PG/50PG
Above shown is JW-50PG.)

Commercial PROM programmer

Note 2: Before installing the EPROM chip on the PROM programmer, leave it in the ultra violet eraser for more than 30 minutes until its contents are completely erased.

Note 3: ROM operation is not available using the ZW-4MA, JW-4MAH memory module in the JW70/100, JW70/100H system.

Note 4: The contents of registers 29000 through E1777 cannot be transferred to ROM.

*1 Previous page

Install the programmed EPROM chip in the IC socket on the memory module (ensure correct orientation).

(Note 1)
(Note 2)

Set the ROM/RAM switch (SW2) on the memory module to ROM.

(Note 2)

Set the EPROM/EEPROM switch (SW1) on the memory module to ROM.

(Note 2)

Install the control module onto the rack panel.

Turn the PC power ON.

If 00_(H) is set in #0255, the PC starts running on the RAM program.

If 11_(H) is set in #0255, the PC starts running on the program transferred from ROM to RAM. (operation with battery previous mode when last turned OFF at power ON). **Note 3**

If 22_(H) is set in #0255, the PC halts with ROM contents transferred to RAM. (Operation without battery)

If 44_(H) is set in #0255, the PC starts running on the program transferred from ROM to RAM. (Operation without battery.)

End

Note 1: ROM (EPROM, EEPROM) installation

Orient the ROM so that it is aligned with the IC socket. Check that the ROM is properly oriented and the pins are not bent.

Note 2: Location of IC socket and location and setting of switches.

- ZW-1MA/2MA/3MA: See page 5-6
- JW-1MAH/3MAH : See page 5-8
- JW-2MAH : See page 5-9

Note 3: When the JW50H/70H/100H is used. Value 11_(H) cannot be set to #0255 when the JW50/70/100 is used.

[2] Procedure when using EEPROM

The following describes how to use an EEPROM chip (ROM model name: AT28C64B-15PC or AT28C256-15PC):

Store the program and data into the PC's RAM with battery backup.

Turn the PC power OFF.

Remove the control module from the rack panel.

Install the written EEPROM chip in the IC socket on the memory module.

(Note 1)

(Note 2)

(Note 3)

Set the memory module's ROM/RAM selector switch (SW2) to RAM.

(Note 2)

Set the memory module's EPROM/EEPROM selector switch (SW1) to EEPROM.

(Note 2)

Install the control module onto the rack panel.

Set the control module's memory protect switch to ON (write protect).

Turn the PC power ON.

Set the control module's memory protect switch to OFF (write enable).

(Note 4)

*To next page.

Note 1: ROM(EPROM, EEPROM) installation

Orient the ROM so that it is aligned with the IC socket. Check that the ROM is properly oriented and the pins are not bent.

Note 2: Location of IC socket and location and setting of switches

- ZW-1MA/2MA/3MA: See page 5-6
- JW-1MAH/3MAH: See page 5-8
- JW-2MAH: See page 5-9

Note 3: The steps enclosed within the dotted line are needed to protect the contents of the PC's internal RAM during the power-ON performed after an already written EPROM is installed on the memory module.

Note 4:

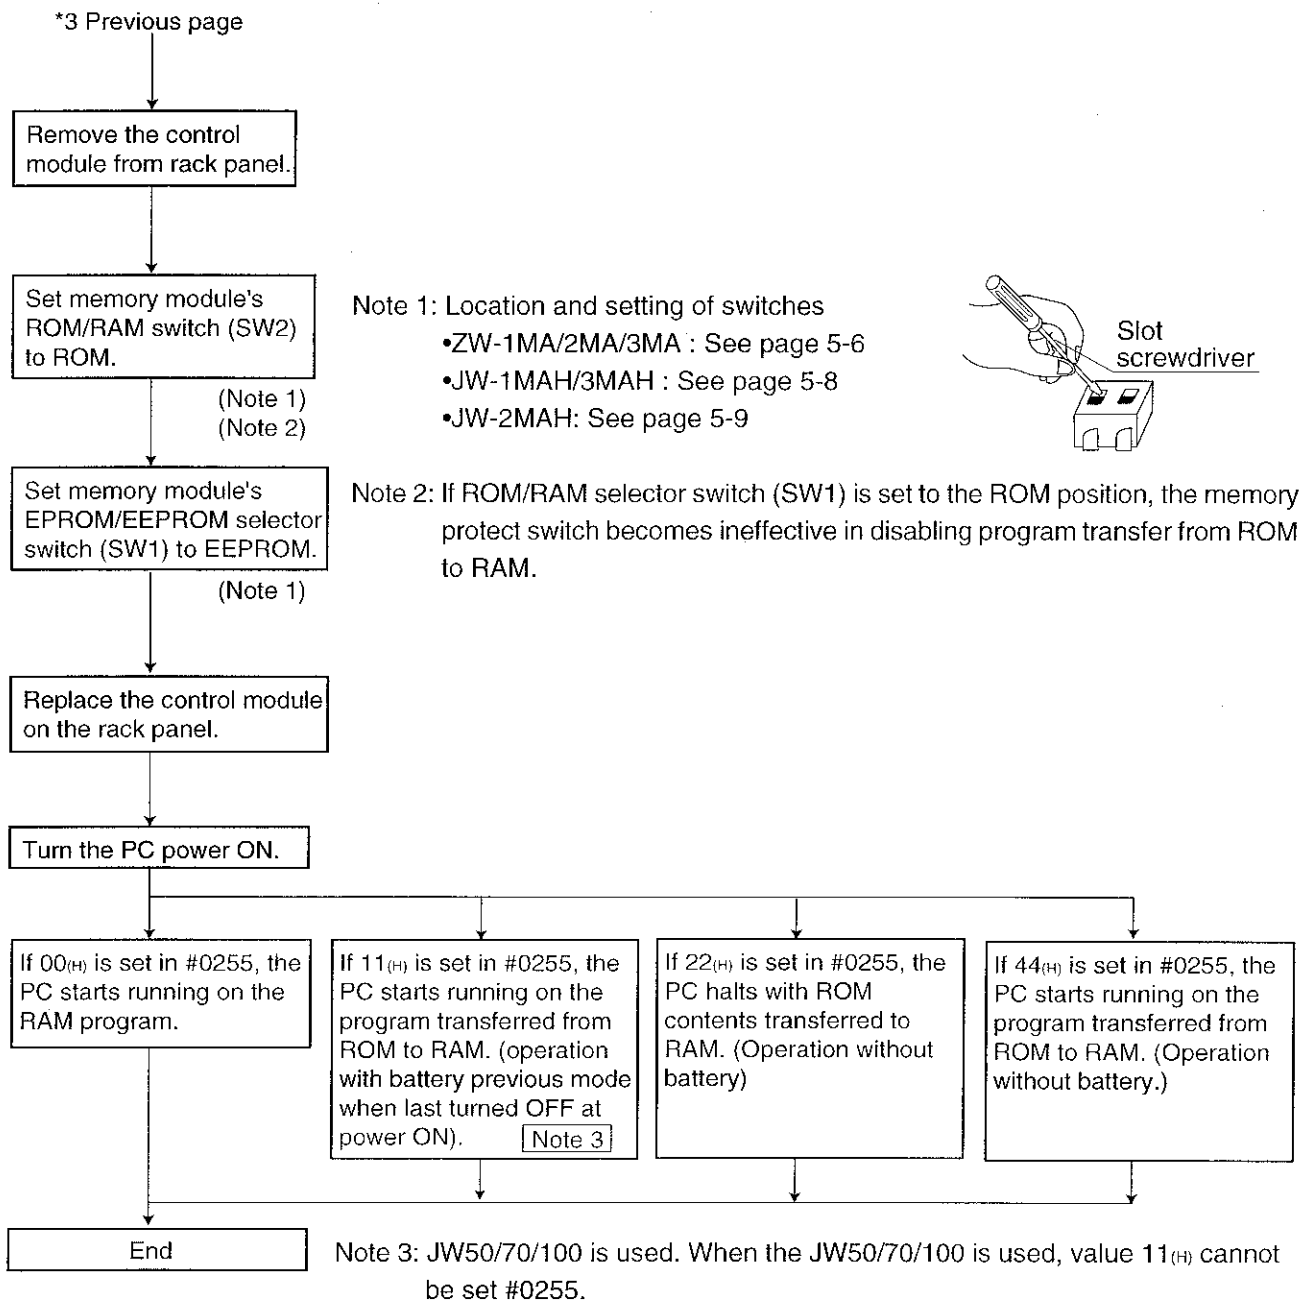

System memory	Octal	Hexa-decimal	Contents
#0255	000 ⁽⁸⁾	00 ^(H)	RAM operation (operation with battery)
	021 ⁽⁸⁾	11 ^(H)	ROM operation (previous mode when last turned OFF at power ON) [Note 1]
	042 ⁽⁸⁾	22 ^(H)	ROM operation (operation without battery, halt at power ON)
	104 ⁽⁸⁾	44 ^(H)	ROM operation (operation without battery, run at power ON)

Note 1: When the JW50/70/100 is used, value 11^(H) cannot be set to #025. To execute ROM operation on the JW50/70/100 (with battery), set value 000^(octal) and then use the hand-held programmer to perform the ROM to RAM transfer.

	Setting value		Contents to be mapped onto ROM				ROM type	ROM model
	Octal	Hexa-decimal	System memory	User program	Register	File 1		
System memory address #0256	000 ⁽⁸⁾	00 ^(H)	—	—	—	—	—	—
	146 ⁽⁸⁾	66 ^(H)	#0200 to #2177	3.5 K words	—	—	EEPROM	AT28C64B-15PC (ATMEL)*
	167 ⁽⁸⁾	77 ^(H)	#0200 to #2177	31.5 K words	—	—	EPROM	27C512 (Fujiitsu)
	200 ⁽⁸⁾	80 ^(H)	#0200 to #2177	15.5 K words	—	—	EEPROM	AT28C256-15PC (ATMEL)*
	201 ⁽⁸⁾	81 ^(H)	#0200 to #2177	7.5 K words	09000 to 09777	19000 to 19777		
	202 ⁽⁸⁾	82 ^(H)	#0200 to #2177	7.5 K words	—	16K bytes		
	203 ⁽⁸⁾	83 ^(H)	#0200 to #2177	—	09000 to 09777	19000 to 19777		
	204 ⁽⁸⁾	84 ^(H)	#0200 to #2177	—	—	31K bytes		

Note 2: Do not operate the programmer's keys until value "000" or "001" is displayed for address #0020. Using hand-held programmer, operate the exclusive operation for writing a program to an EEPROM. A display isn't changed by writing directly a system memory.

Note 3: Value "001" indicates that an error was detected by a read-after-write test on the ROM.

7-4 ROM operation method

ROM operation is possible with or without a backup battery.
See page 7-10 for details on the operation without battery.

[1] ROM operation with backup battery

If the following conditions are set on the JW50H/70H/100H, ROM operation is automatically executed with battery when the power is turned ON. This type of ROM operation is not possible on the JW50/70/100.

•Only in case of JW50H/70H/100H

Item	Contents
ROM chip	Installed
ROM-RAM switch	ROM side
Memory protect switch	Invalid
System memory address #0255	11 ^(H)
System memory address #0256	ROM type specified

[2] ROM operation without backup battery

If the following conditions are set on the JW50/70/100 or JW50H/70H/100H, ROM operation is automatically executed without battery when the power is turned ON.

Item	Contents
ROM chip	Installed
ROM-RAM switch	ROM side
Memory protect switch	Invalid
System memory address #0255	22 ^(H) , 44 ^(H)
System memory address #0256	ROM type specified

Note 1: At power ON, the control module performs a self-diagnosis on ROM-to-RAM program transfer. If a FAULT indicator comes on when the system is turned ON for ROM operation, take the necessary action by referring to the programming manual, section 2-8, "Self-diagnosis".

Note 2: The battery-free operation mode is selectable when a backup battery is installed.

[3] Initial ROM operation sequence at power ON

7-5 Battery-free operation

[1] What is battery-free operation?

When a ROM chip storing the user program is installed, the PC can be operated without a RAM backup battery.

[2] Precautions for battery-free operation

Battery-free operation is possible if your system meets all of the following conditions :

- (1) At power ON, the program must be transferred from ROM to RAM. The total overhead required is approximately 4 seconds, including the program transfer time (approx. 2 sec. for 7.5 K-word program). (For RAM operation, this overhead is shortened to approx. 2 sec.)
- (2) All differentiation memories are set.
- (3) All latch relays are reset.
- (4) The contents of all counters, timers, and registers are cleared.
- (5) The contents of file registers become indefinite (not cleared). However, if the data for file registers are stored in ROM (202₍₈₎ or 204₍₈₎ set in #0256), they will be transferred from ROM to the file registers at power ON.
- (6) The real time clock stops functioning at power OFF. It restarts functioning with-year-month-data-hour-minute-second at a subsequent power ON.
- (7) The data for the latched relays, current values of the counters, registers and file registers are not saved whenever power is interrupted.

[3] ROM types usable for battery-free operation

For battery-free operation, the user program must first be written into a ROM chip. The ROM programming and system setup procedures differ depending on the ROM type and model you use. EPROM or EEPROM can be used.

Usable ROM types

ROM type	Model	Remarks
EPROM	27C512	Fujitsu (250 ns)
EEPROM	AT28C64B-15PC*	ATMEL(250 ns)
	μ PD28C64C	NEC (250 ns)
	AT28C256-15PC	ATMEL(250 ns)

* Unavailable for except B version.

Numbers given in parentheses indicate access time.

Note: Battery-free operation is not possible using the ZW-4MA or JW-4MAH memory module.

[4] Procedure for battery-free operation.

Prepare for battery-free operation in the following manner :

	Octal	Hex	Contents
System memory address #0255	042 ₍₈₎	22 _(H)	ROM operation (battery-free operation, halt at power ON)
	104 ₍₈₎	44 _(H)	ROM operation (battery-free operation, run at power ON)

Note 1: Battery-free operation is not possible unless value 22_(H) or 44_(H) is set in system memory address #0255. Since the contents of address #0255 are also stored into ROM, they must be set before the ROM chip is programmed.

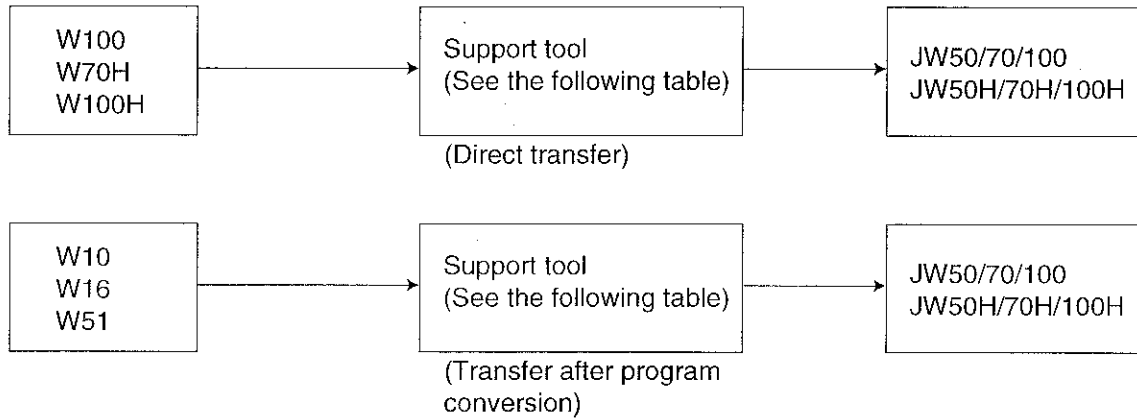

Note 1: After disconnecting the battery from CN5, be sure to install the battery-free operation plug on it in place of the battery harness plug. Otherwise a battery error will occur, in which case error code "22" is written into system memory locations #0160 to #0167, with special relay 07372 activated.

Note 2: Normal PC operation can be continued by ignoring a voltage dip. The default voltage dip detection interval is 10ms. You can vary this interval over the range from 0 to 255 ms by setting the appropriate value into system memory address #0246, although the available range may be limited depending on the number of I/O and/or option modules used in the system. For details on setting system memory, see the programming manual, section 2-4-5, "Control module function setting area."

Note 3: In the battery-free operation mode, the contents of the counters, registers, and file registers, and the status of the latch relays will not be maintained against power failure.

Chapter 8. Program transfer

The JW-series programmable controllers have upward compatibility with the conventional W-series PCs(W10/16/51/100/70H/100H). A program written for a W-series PC and be transferred to the JW-series PC and executed on it. Some restrictions exist, however, due to the difference in the number of I/O points and the I/O format:

[1] Usable support tool

Any of the following support tools can be used for program transfer.

Model name	Support tool type
JW-50SP JW-100SP	Ladder software
JW-30PG JW-32PG JW-40PG	Multipurpose programmer
Z-100LP2S	Ladder processor II

[2] Notes on program transfer

Before transferring a program to the JW-series PC, check to make sure the following things.

1) Capacity matching

The PC's program memory capacity and/or the number of I/O points exceed those of the source PC.

JW PC	Memory module	Program memory capacity	File register capacity	No. of I/O points
JW50 JW50H	ZW-1MA, JW-1MAH	7.5K words	16K bytes	512 points
JW70 JW70H	ZW-1MA, JW-1MAH	7.5K words	16K words	1024 points
	ZW-2MA, JW-2MAH	15.5K words	64K words	
	ZW-3MA, JW-3MAH	31.5K words	128K words	
	ZW-4MA, JW-4MAH	63K words	448K words	
JW100 JW100H	ZW-1MA, JW-1MAH	7.5K words	16K words	4096 points
	ZW-2MA, JW-2MAH	15.5K words	64K words	
	ZW-3MA, JW-3MAH	31.5K words	128K words	
	ZW-4MA, JW-4MAH	63K words	448K words	

Note : If the source (W series) PC's program memory capacity and/or the number of I/O points exceed those of the destination (JW-series) PC, transfer will not occur due to a "Memory capacity mismatch" error.

2) Program transfer from JW-series PC to W-series PC

The JW-series PCs feature system memory and some expansion application instructions which are not available on the W series PCs. A program containing application instructions which are not included in the W-series PC.

Only a program written using functions available on the destination PC can be transferred.

3) Transfer between JW50/70/100 and JW50H/70H/100H

Compared to the JW50/70/100, the JW50H/70H/100H features additional functions, such as some of the application instructions. The transfer operation shown below is limited to programs which do not exceed the range of functions provided by the JW50/70/100.

4) Differences between the JW-series PCs and the W100

The W100 has some differences from the JW-series PCs and its program requires the following modifications before this can be transferred to the JW-series PC:

(1) If an unused I/O address area exists between the OUT1 and OUT2 areas used by the W100 PC program:

*When the JW-series PC is in the ZW-I/O mode (control module's DIP switch SW2-2 set to OFF), I/O relay addresses in OUT2 area require modifications.

	W100's I/O address allocation	Countermeasure
1	Program using only OUT1 area 	Not necessary for countermeasure
2	Program using only OUT1 area 	Not necessary for countermeasure <div style="border: 1px solid black; padding: 2px; display: inline-block;">Note 2</div>

Note 1: Using the I/O expansion module makes an area similar to OUT2 area available. See page 4-93, "I/O expansion module" of this manual.

Note 2: The JW50/70, JW50H/70H control modules do not allow this type of use, as they have max. 1024 I/O points.

Note 1: Use the ladder processor II to relocate the programmed I/O address space.

Note 2: If the I/O expansion module is used in the ZW-I/O mode, relocation of the I/O address area is not necessary since a dummy area can be defined. For more details, see page 4-93.

(2) Allowable voltage interruption time

The JW-series PCs have a power lapse detection interval setting feature which must be set in system memory address #0246. Write 012₍₈₎ for an interval of 10ms into address #0246.

System memory	Setting value
#0246	012 ₍₈₎

[3] Program transfer procedure (ZW to JW)

It is not possible to directly transfer a program written for a W-series PC to the JW-series PC. First load the source system's program into a support tool, then transfer it to the destination PC.

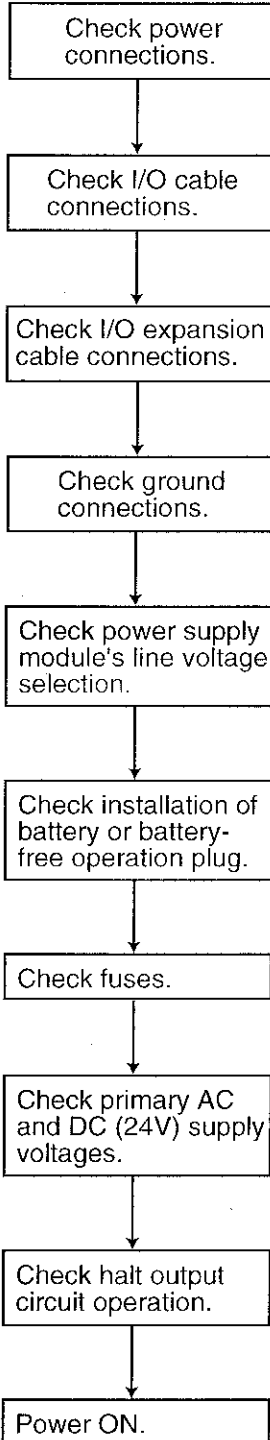

For more details on program transfer procedures, refer to the instruction manual for each support tool.

Chapter 9. Trial run

9-1 Periodical check

After all connections to and within the PC have been completed, go through the following checklist before powering-up:

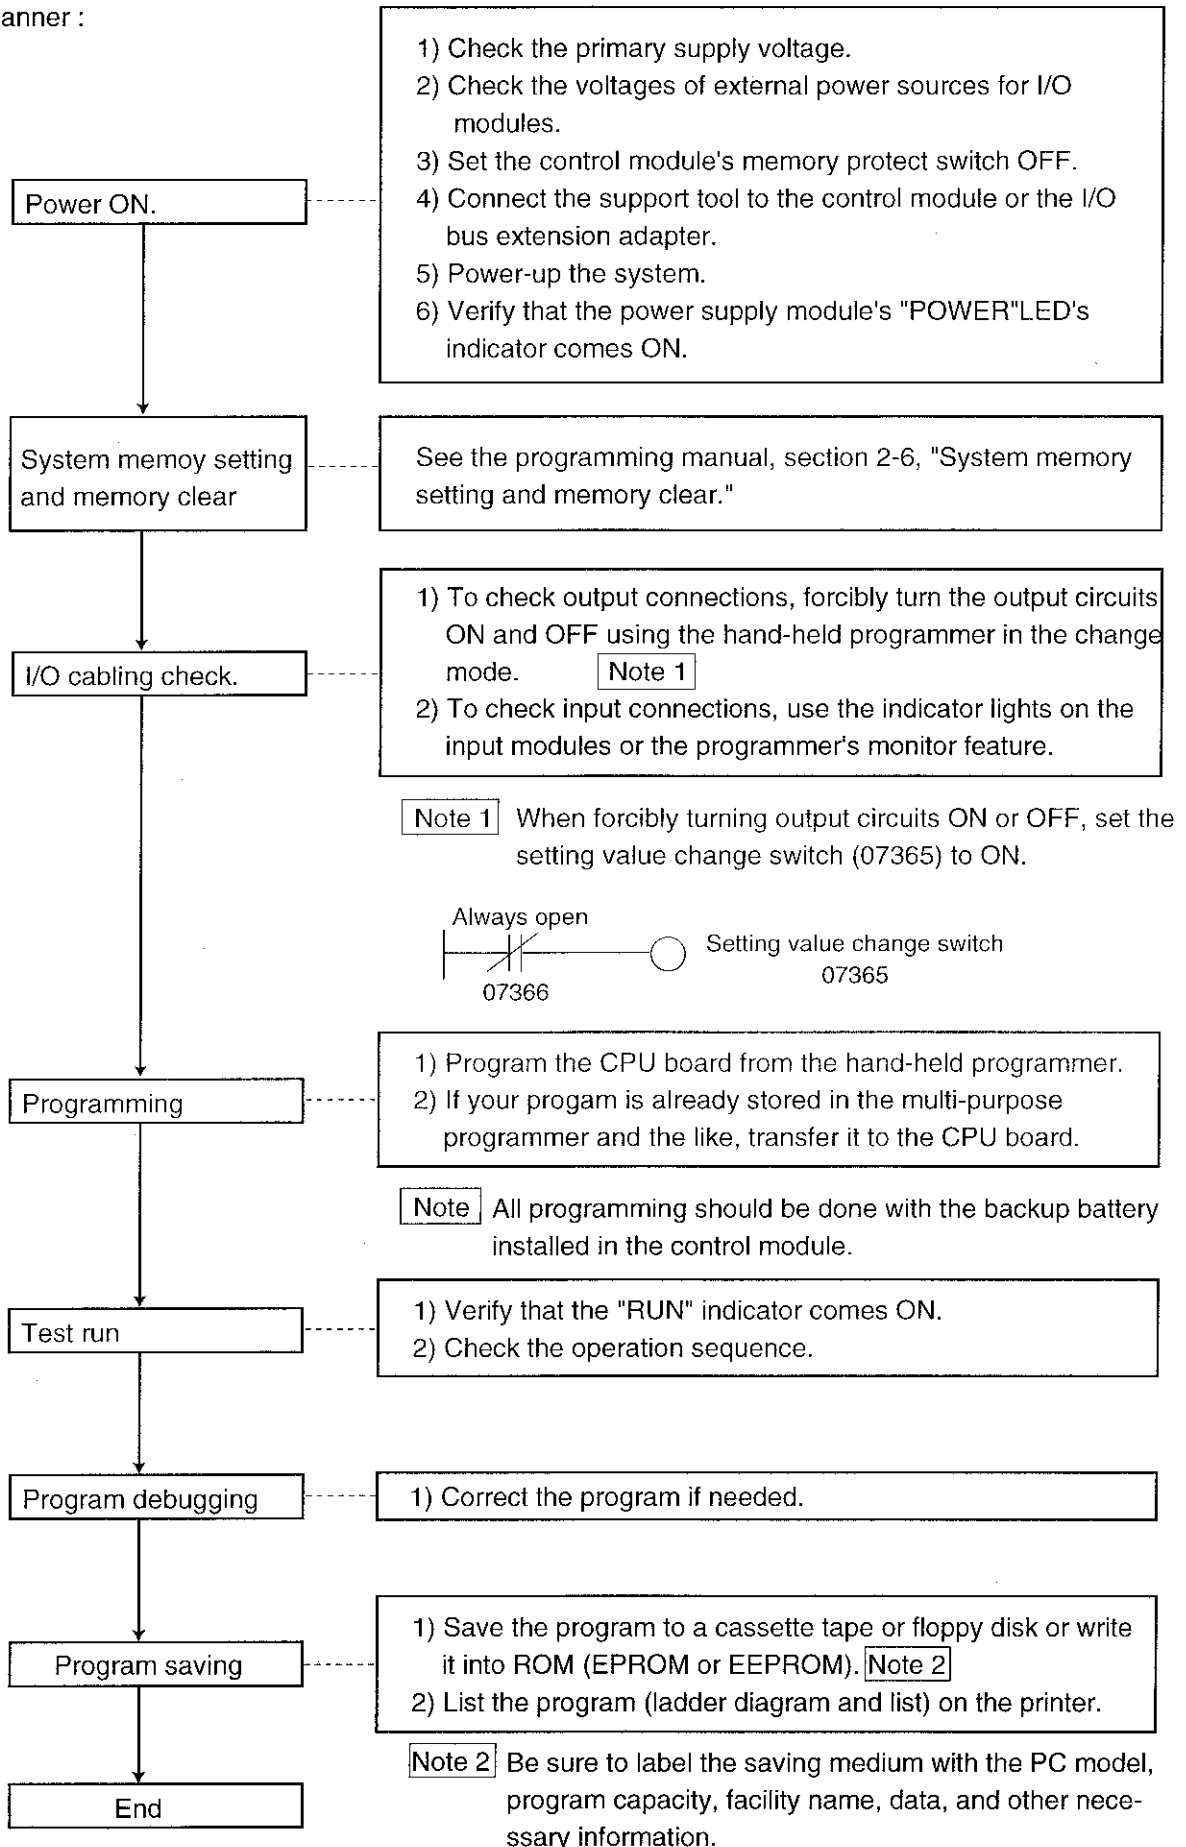

No.	Item	Check
1	Power and I/O line connection check	<ul style="list-style-type: none"> · Are all cable connections correct? · Are all terminal screws firmly tightened? · Are all cables firmly secured to the rack panels? · Are power supply wires twisted together? · Do wire sizes meet the specifications?
2	I/O expansion cable connection check	<ul style="list-style-type: none"> · Are all expansion cables interconnecting the rack panels properly connected and clamped?
3	Ground check	<ul style="list-style-type: none"> · Is the PC frame properly grounded to class-3 grounding? · Verify that it does not share the same ground with high-power equipment.
4	Power supply module's primary voltage selection check	<ul style="list-style-type: none"> · Is the power supply module's primary voltage selector set to the position that corresponds to the primary supply voltage?
5	Memory module installation check	<ul style="list-style-type: none"> · Is the memory module installed in the control module? · Is the ROM chip for ROM operation installed?
6	Battery or battery-free operation plug installation check	<ul style="list-style-type: none"> · Is a battery cell installation in control module's battery holder and properly connected? (for RAM operation) · Is the battery-free operation plug installed on the CPU board battery connector? (for battery-free operation)
7	Fuse check	<ul style="list-style-type: none"> · Verify that none of the fuses in the power supply and I/O modules are burnt through or damaged.
8	Halt output circuit check	<ul style="list-style-type: none"> · Is the HALT signal properly included in the shut-off sequence external to the PC?
9	Supply voltage check	<ul style="list-style-type: none"> · Verify that the primary source voltages are within the following ranges: <ul style="list-style-type: none"> (AC line power) 100 VAC: 85 to 132 VAC 200 VAC: 170 to 264 VAC (DC power supply) 24 VDC: 20.4 to 32.0 VDC (I/O module's a external power source) Check the voltage of the external power source used for DC or conatct output modules (ZW-16S2, etc.)

Note: The tolerance of the supply voltage for the expansion power supply module is 100 VAC + 10% to 15% or 200 VAC +10% to 15%.

9-2 Test run procedure

After all checks described in the previous section are completed, start a test run in the following manner :

9-3 Live I/O replacement

The PC's "Live I/O replacement" feature allows you to replace I/O modules with th system power left ON.

[1] Entering the live I/O replacement mode

With the hand-held programmer connected to th support tool port of the control module or I/O bus extension adapter (JW-2EA), key in:

The PC has now entered the live I/O replacement mode, wherein:

- The PC stops all I/O and operational processing.
- The halt output circuit is left turned ON. (closed).
- The RUN indicator alternately flashes (for approx. 0.8 sec.) and comes on (for approx. 0.8 sec.).

You can now replace any I/O module.

Note : Special I/O modules cannot be replaced in the live I/O replacement mode.

[2] Resuming system operation

After completing I/O module replacement, resume system operation from the support tool by typing:

The support tool returns to the monitor mode.

Note : Only one support tool can be connected to the system, even if more than one rack panel is used in the system.

[3] Usable support tool

Type	Model name
Hand-held programmer	JW-10PG/11PG/12PG/13PG/14PG

Chapter 10. Support tool operation

The support tools are used to create, monitor or modify programs for the PC. The various tools which support the functions of the control modules are listed below.

Control module	Support tool				
	Hand-held programmer			Multi-purpose programmer	
	JW-10PG	JW-11PG	JW-12PG/13PG/14PG	JW-30PG/32PG	JW-40PG/50PG
JW-50CU	△	○	○	○	○
JW-70CU					
JW-100CU					
JW-50CUH	△	○	○	△	○
JW-70CUH					
JW-100CUH					

Note 1

Control module	Support tool			
	Programmer	Ladder processor II	Ladder software	
	ZW-101PG1	Z-100LP2S	JW-50SP	JW-100SP
JW-50CU	△	○	○	○
JW-70CU				
JW-100CU				
JW-50CUH	△	△	○	○
JW-70CUH				
JW-100CUH				

Note 2

Note 2

○: Can be used.

△: Can be used within the functional range of the support tool.

(For example, if the JW-30PG/32PG is used for the JW-50CUH/70CUH/100CUH, the newly added instructions and functions on the JW50H/70H/100H will not be supported.)

Note 1: The circle only for the high-speed compatible version. The triangle for all other versions. (See the next page.)

Note 2: Installation of the expansion module (Z-3LP2EM) to the Z-100LP2S is required.

Note: Exercise care when displaying TMR/CNT 1000 to 1777 are shared with general-purpose relays 13000 to 14777.

Setting of system memory #0201	H-series compatible support tools	Other support tool
512 timer and counter points	Displays as 13000 to 14777.	Incorrectly displayed.
1024 timer and counter points	Correctly displayed	

Note: When the system memory of the JW50H/70H/100H is cleared with a support tool (including those that are not H-series compatible), the program memory capacity is set to the maximum capacity of the installed memory module. (The capacity is set to 7.5K words on the JW50/70/100.)

See the instruction manual included with your support tool for details regarding the operation.

"10-1 Hand-held programmer (JW-11PG/12PG/13PG/14PG)" is provided for reference.

10-1 Hand-held programmer (JW-11PG/12PG/13PG/14PG)

[1] Connecting to the control module

The hand-held programmer connects to the support tool port connector on the control module using the ZW-3KC cable (optional).

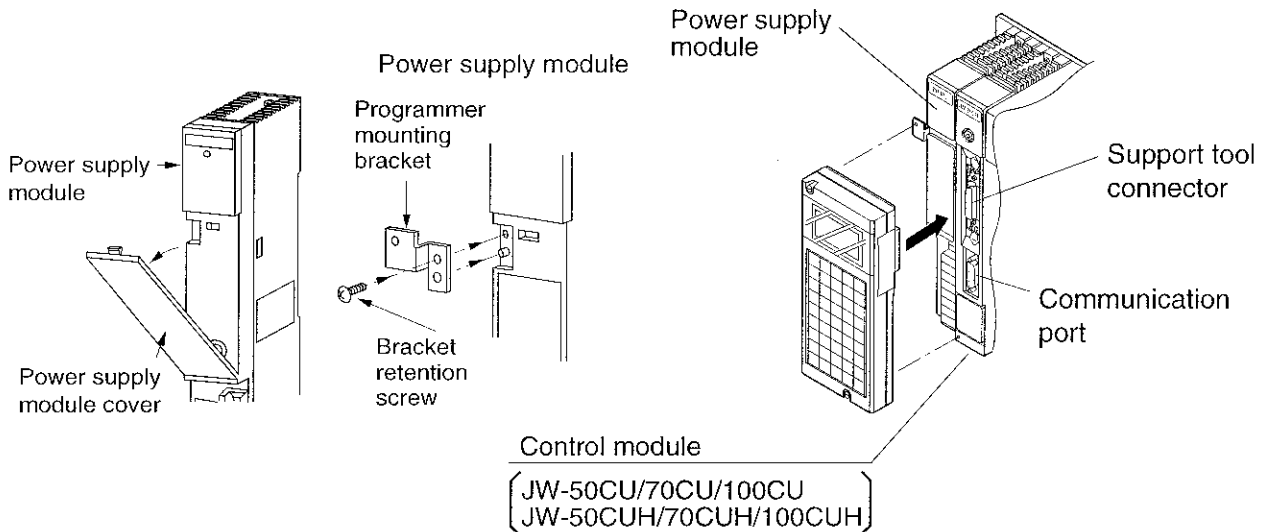

Note 1: Refer to page 11-3, if it is impossible for support tools to operation "write".

Note 2: Use the JW-11PG (compatible with high-speed model), JW-12PG/13PG/14PG for the JW-50CUH/70CUH/100CUH.

Otherwise the hand-held programmer can be directly mounted on the control module by using the mounting bracket supplied with the programmer.

[Installing mounting bracket on power supply module]

Remove the front cover from the power supply module and secure the mounting bracket to the power supply module with a screw as shown:

[Installing programmer]

Plug the hand-held programmer's back connector plug into the support tool port connector on the control module, then secure the programmer to the mounting bracket using two screws.

Note: Before mounting the programmer on the control module, remove the communication port connector cover from the control module. Keep the cover in a safe place.

[2] Table of function

The hand-held programmer (JW-11PG/12PG/13PG/14PG) which has as following functions.

Function		Mode				
		Program	Monitor	Change	Terminal	Initial
PC mode		Stop	Run	Run	—	—
1	Memory clear (all memories: program, data, file, and system memories)	○				
2	System memory read	○	○	○		
	System memory write	○				
3	Instruction read	○	○	○		
	Write, insert, delete, batch write, batch insert, and batch delete instructions	○				
	Program copy (write, insert)	○				
4	Read relay ON/OFF status	○				
	Set/reset relays	○	○	○		
5	Read timer, counter, and MD's current values	○	○	○		
	Set/reset timers and counters			○		

Function		Mode				
		Program	Monitor	Change	Terminal	Initial
6	Read register and file register's current values (binary, octal, decimal, hex, and ASCII)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
	Write, insert, delete, batch write, batch delete, copy write, and copy insert current values of registers and file registers	<input type="radio"/>		<input type="radio"/>		
7	All memory read	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
	All memory write	<input type="radio"/>				
8	Instruction search	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
	Data memory search	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
9	Change preset values of timers, counters, and MDs	<input type="radio"/>		<input type="radio"/>		
	Change constants for application instructions	<input type="radio"/>		<input type="radio"/>		
10	Forced ON/OFF control over I/O relays			<input type="radio"/>		
	Break monitor	<input type="radio"/>		<input type="radio"/>		
	Step operation	<input type="radio"/>		<input type="radio"/>		
	N-scan operation	<input type="radio"/>		<input type="radio"/>		
11	Device features (display output, key entry)				<input type="radio"/>	
12	Program check	<input type="radio"/>				
	Parity check	<input type="radio"/>				
13	Cassette tape transfer (save, verify)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
	Cassete tape transfer (load)	<input type="radio"/>				
14	EEPROM write/read	<input type="radio"/>				
15	I/O module setup (I/O address and dummy areas)					<input type="radio"/>
	I/O information monitor (address, type, No. of points)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
	I/O module's lamp check	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
16	Time setting					<input type="radio"/>
	Time monitor	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		
17	Remote parameter setting					<input type="radio"/>
	Set parameters for communication module					<input type="radio"/>
	Remote programming					<input type="radio"/>
	Remote monitoring					<input type="radio"/>
18	Key press tone ON/OFF control	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>
	EL backlight ON/OFF control	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>
	LCD contrast adjustment	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>

[3] Handling

For handling of the hand-held programmer, see the instruction manual for the programmer.

Chapter 11. Maintenance and inspection

11-1 Periodic check

[1] Check items

The following lists daily and periodic check items required to maintain the programmable controller in its best condition :

(1) General check

Check item	Check	OK/NG judgment criteria	Remarks
Ambient temperature	Check that all of these parameters fall in the ranges of specifications. (Where the PC is installed in a cabinet, the temperature within the cabinet should be within the allowable range.)	0 to +55 degrees	Check for condensation
Ambient humidity		35 to 90% RH	
Atmosphere		No corrosive gas	
Vibration		None	
Impact		None	

(2) Control module

Check item	Check	OK/NG judgment criteria	Remarks
Fault indicator	Visually check FAULT indicator	Off	
Battery	Does battery require replacement?	Within the replacement interval?	For RAM operation only
Module installation	Is module firmly secured to rack panel?	No loose module	
	Are terminal screws firmly tightened?	No loose screw	
	Are all I/O expansion cable plugs firmly clamped?	Firmly clamped	

(3) Program

Check item	Check	OK/NG judgment criteria	Remarks
Memory capacity	Is the memory module model being used labeled?	Must be labeled at an easy-to-read location inside the cabinet.	Needed for CPU board replacement.
Floppy disk	Does the program diskette require rewriting?	No loose module No loose screw	
	Does the data diskette require rewriting?	Firmly clamped	Not needed if data memory contents need not be stored.

Note : For easier program maintenance, we recommend that you store your programs on floppy disks.

(4) I/O modules

Check item	Check	OK/NG judgment	Remarks
Input or output voltages	<p>Verify that input and output module's I/O signal voltages fall within the specified ranges.</p> <p>Note 1: Turn-ON voltages are specified for input modules.</p> <p>Note 2: For the ZW-8S2 and ZW-16S2 output modules, also note the external power sources' voltages.</p>	100 VAC input modules: 85 to 132 VAC	JW-11N JW-31N
		DC input modules : 10 to 26.4 VDC	JW-12N JW-32N JW-34N
		200 VAC input modules: 170 to 264 VAC	JW-13N
		DC output modules : 4.75 to 30 VAC	JW-12S JW-32S
		DC output modules : 10 to 30 VAC	JW-35S
		200 VAC output modules : 15 to 264 VAC	JW-13S JW-33S
		Conatct output modules : AC: 264 VAC or less DC: 30 VDC or less	JW-34S
		100 VAC input modules: 80 to 121 VAC	ZW-16N1
		100 VAC input modules: 80 to 121 VAC	ZW-32N1T
		DC input modules: 10 to 30 VDC	ZW-16N2
		Data input modules: 10 to 26.4 VDC	ZW-32N2 ZW-32N2T ZW-64N2
		200 VAC input modules: 160 to 242 VAC	ZW-16N3
		100 VAC output modules: 15 to 121 VAC	ZW-8S1 ZW-16S1
		100 VAC output modules: 15 to 121 VAC	ZW-32S1T
		DC output modules: 10 to 30 VAC (Note 2)	ZW-8S2 ZW-16S2 ZW-64S2
		Data output modules: 4.75 to 30 VDC	ZW-32S2 ZW-32S2T ZW-32STD
		200 VAC output modules: 15 to 242 VAC	ZW-16S3
		Conatct output modules: AC: 240 VAC or less DC: 30 VDC or less	ZW-32S5
		Source-type data output modules: 4.75 to 30 VDC	ZW-32IO2
		Pulse catch modules: 12/24 VDC or 10.8 to 26.4 VDC	ZW-14PC2
Pulse output modules: 12/24 VDC	ZW-1PO2		
Installation	Verify that all modules are firmly secured to the rack panels.	No loose module	
	Verify that all terminal screws are firmly tightened.	No loose screw	

(5) Power supply module and expansion power supply module

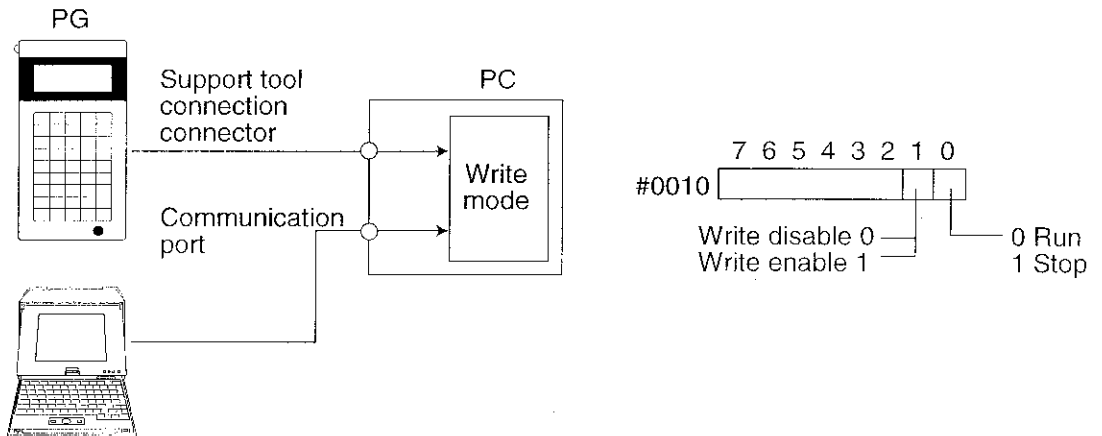

Check item	Check	OK/NG judgment criteria	Remarks
Primary input voltage	Verify that the primary input voltage measured at the power receiving terminal block is within the range specified for each module.	-15% to +10% of the ratings	Note 1
Installation	Verify that the module is firmly secured to the rack panel.	No loose module	
	Verify that all terminal screws are firmly tightened.	No loose screw	

Note 1: The rated primary input voltage for the JW-1PU power supply module is 85 to 132 VAC or 170 to 264 VAC.

That for the JW-2PU power supply module is 20.4 to 32.0 VDC.

[Reference] Notes on the support tool connector

- Mode changes for the JW70/100 and JW70H/100H can be performed via the support tool connector or the communication port (see page 4-103).
- If write operations are ineffective through the support tool connector on the JW70/100, it is possible that the write mode of the PC has been changed through the communication port. If this is the case, set the mode again. The write mode switches upon receiving an instruction from the port for which the mode was set. The programmer's mode display does not change, even if the mode is changed through the communication port.
- When write operations are ineffective, monitor memory location #0100 in system memory.

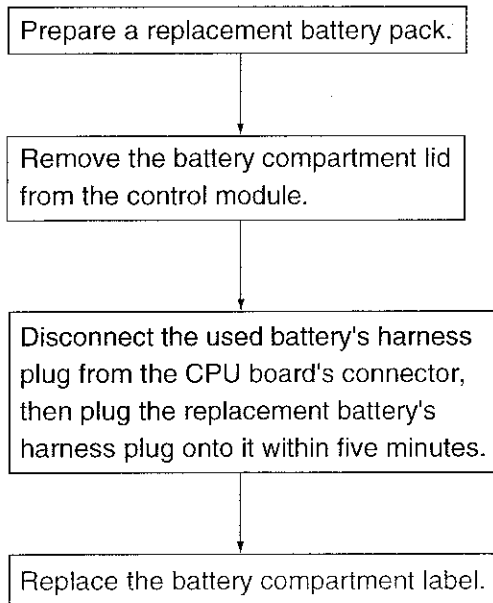

11-2 Battery replacement

When the programmable controller is run in the RAM operation mode, its internal backup battery requires periodical replacement before it is fully discharged. Battery replacement should be done with the power supply to the control module left active.

1) Power supply module name

DUNT-5784NCZZ

2) Replacement procedure

Note 1: Be sure to replace the battery replacement label. Take care not to lose the battery compartment lid.

Note 2: To prevent rupture or electrolyte leakage, never short the battery terminals, nor recharge, disassemble, or heat the battery, not throw it into a fire.

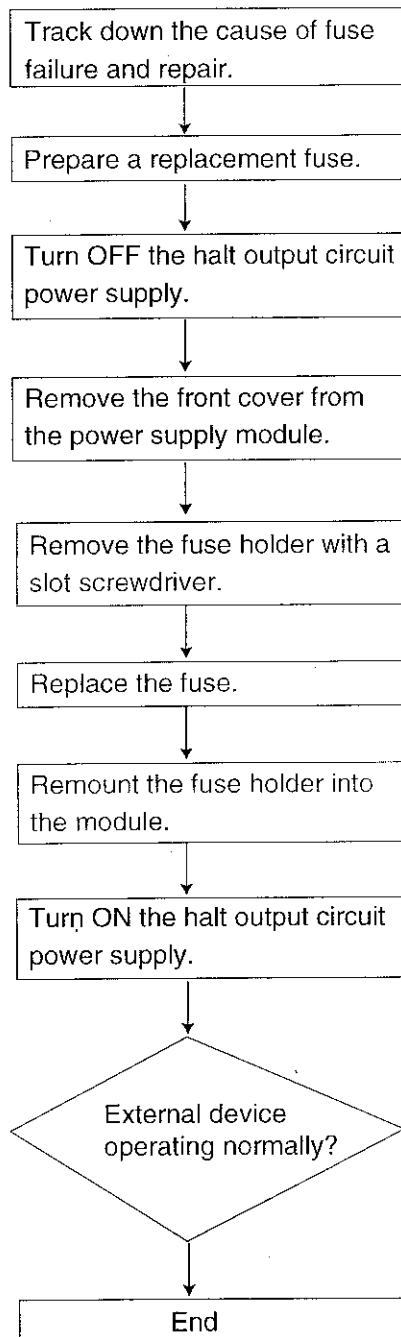

11-3 Replacing a fuse

1) Replacing a fuse (halt output fuse) in the power supply module

(1) Objective fuse

Model	Fuse ratings
JW-1PU	Glass-tubed miniture fuse (normal blow), 250V, 1A(5.2 ϕ × 20), approved UL/CSA
JW-2PU	Glass-tubed miniture fuse (normal blow), 250V, 1A(5.2 ϕ × 20)

(2) Replacement procedure (halt output fuse)

Note 1: Before replacing any fuse, be sure to track down the cause of the fuse failure. If you replace one without identifying the cause, damage to module's internal circuitry may result.

Note 2: If the power supply module's internal AC line fuse is burnt out, call your local Sharp service office in Japan. Do not attempt to replace this fuse as its failure results from a problem in the power supply module's internal circuit.

2) Replacing a fuse in an I/O module

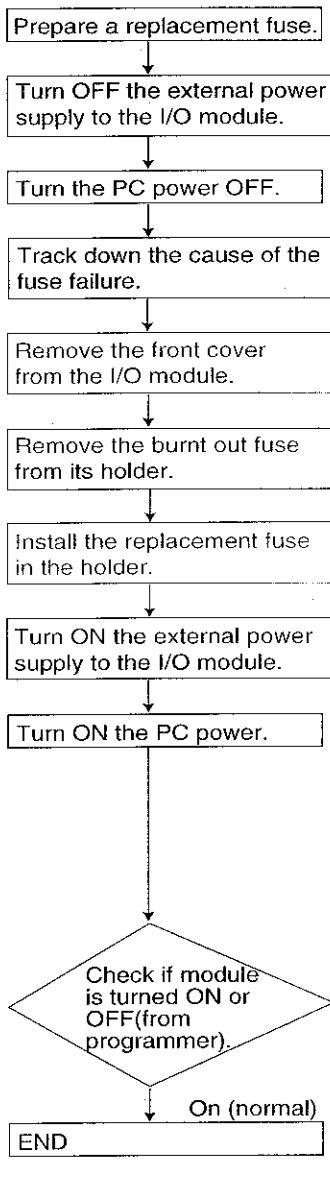

(1) Replacement fuses

Exchange a fuse since you have found a solution of the cause (external wiring, output module failure), when the fuse blown.

Glass-tubed miniature fuse with 125V rating(Class-B normal blow)

Rated current	0.3A	0.5A	1A	2A	5A
Module name	ZW-32IO2 ZW-14PC2	ZW-1HC5	ZW-14PC2	ZW-32IO2 ZW-1HC5	ZW-8S1 ZW-8S2 ZW-16S1 ZW-16S2 ZW-32S2 ZW-32S5

(2) Replacement procedure

Glass-tubed miniature fuse with 250V rating (Slow blow)

Rated current	5A
Module	ZW-16S4

(Normal blow)

Rated current	5A
Module	ZW-16S3

Alarm fuse Note 1

Rated current	3.2A	3.2A
Module	ZW-32S1T	ZW-32S2T
Fuse type	HP-32	HP-50

Alarm fuse

Rated current	5.0A
Module	ZW-32S2TD
Fuse type	MP-50

Glass-tubed miniature fuse (Class-A normal blow)

Rated current	8A	4A
Module	JW-12S JW-32S JW-35S	JW-13S JW-33S
Fuse type	SO(A)-8A 125A	SO(A)-4A 250A

Note 1: Only the ZW-32S1T AC output module and ZW-32S2T data output module contain alarm fuses. If any alarm fuse is burnt out, the fuse light on the corresponding module will come on.

Note 2: Before replacing any fuse, be sure to track down the cause of the fuse failure. If you replace the fuse without identifying the cause, damage to the module's internal circuitry may result.

3) Replacing a fuse in an expansion power supply module

(1) Replacement fuses

Glass-tubed miniature fuse with 250V rating

Rated current	1A(normal blow)	2A(slow blow)	3A(slow blow)
Module	ZW-100PU1 ZW-100PU2	ZW-100PU1	ZW-100PU2
Application	Halt output circuit	Power line	Power line

(2) Replacement procedure

Track down the cause of fuse failure.

Prepare a replacement fuse.

Turn OFF all the external circuits that connect to the module's halt output.

Turn OFF all the external circuits that connect to the module's halt output.

Remove the cover from the module.

Install the replacement fuse in the holder.

Turn ON the external power supply to the I/O module.

Remove the burnt out fuse from its holder.

Install the replacement fuse in the holder.

Turn OFF all the external circuits that use the halt output.

Turn ON the PC power.

Fuse burnt out again?

Yes
Remount the front cover on the module.

End

Note 1: Before replacing any fuse, be sure to track down the cause of the fuse failure. If you replace a fuse without identifying the cause, damage to the module's internal circuitry may result.

Note 2: If the expansion power supply module's internal AC line fuse is burnt out, call your local Sharp service office in Japan.

11-4 Check at error

[1] Precondition of check flow

This troubleshooting describes the countermeasure method (replacement of defective module and subsequent restoring method) in the event the system running normally so far suddenly breaks down. Therefore, the following cases are excluded.

1. Trouble due to error in initial setting when starting up the system (system memory, parameter, setting switch, etc.)
2. Momentary failure due to transient error due to noise or other effect (irreproducible trouble).
3. Trouble due to effect of ladder program (customer's application).

See each instruction manual for troubleshooting of special I/O module and option module with this manual.

[2] Prepare for causing trouble

1. Be sure to keep backup for program memory and system memory

When the control module is abnormal, the current program memory and the like may not be saved by the support tool, or the saved data may be incorrect. Therefore, store the latest program memory and backup of system memory always in the floppy disk (FD).

In the case of ROM operation, store the backup in the FD, too.

2. Prepare for support tool at hand

Prepare the support tool (JW-50SP, JW-100SP, etc.) that can load/save of hand-held programmer of program(JW-14PG, etc.).

3. Prepare for spare parts

Prepare always a spare of each module to be ready for error.

4. Prepare for setting table of each module

For prompt troubleshooting, prepare the "switch setting table and I/O relay allocation table of each module.

Prepare also the parameter setting table in the module which requires setting of parameter aside from switches, such as special I/O module and option module.

[3] State of LED

In the event of error, check the LED(RUN, FAULT) of the power supply module and control module, and remedy according to the check flow depending on the state.

RUN	FAULT	Contents	Check flow	See page
OFF○ ON● Blink◎	ON● ON● OFF○	Disable detection error by self-diagnosis	Check flow 1	11-9
OFF○	OFF○	Power supply error	Check flow 2	11-15
Blink◎	OFF○	Halt mode	Check flow 3	11-16
ON●	OFF○	Support tool error	Check flow 4	11-16
		Halt output error	Check flow 5	11-17
		Input relation	Check flow 6	11-18
		Output relation	Check flow 7	11-19

[4] Check flow

Check flow 1

Monitor system memory #0160 using a hand-held programmer.

(Operation in hand-held programmer)

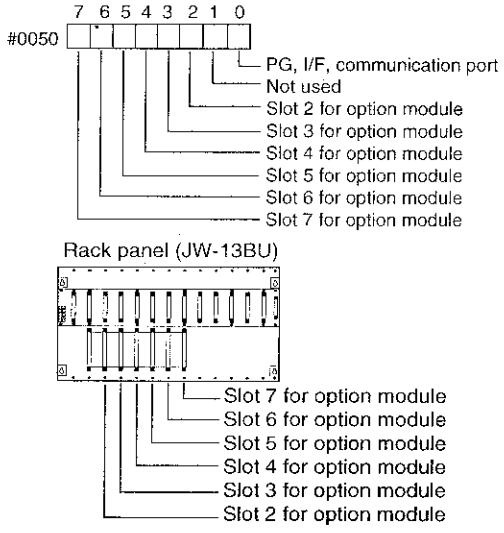

Error Item	Value ^(H) of #160	Description	Corrective actions (Execute the operation steps in this sequence and end the action when the normal status has been recovered.)															
Memory error	21	Parity check	① Load the programs to the program memory again. ② Replace the memory module. ③ Replace the control module. (Reference) You can check the parity with the hand-held programmer and obtain the program address of parity error. [Hand-held programmer key-in procedure] Set the program mode. (Omit the steps when the program mode has been set.) <div style="text-align: center;"> Continuous check </div>															
	23	System memory setting check	① Load the system programs to the system memory again. ② Replace the memory module. ③ Replace the control module.															
	24	Command code check	① Load the programs to the program memory again. ② Replace the memory module. ③ Replace the control module. (Reference) You can monitor the system memory #0052 to #0054, and obtain the defective program address. <div style="text-align: center;"> <table border="1" style="margin: auto;"> <tr> <td style="text-align: center;">#0054</td> <td style="text-align: center;">#0053</td> <td style="text-align: center;">#0052</td> </tr> <tr> <td style="text-align: center;">File No.</td> <td style="text-align: center;">File No.</td> <td style="text-align: center;">File No.</td> </tr> <tr> <td style="text-align: center;"> </td> <td style="text-align: center;"> </td> <td style="text-align: center;"> </td> </tr> <tr> <td style="text-align: center;">6th digit</td> <td style="text-align: center;">5th digit</td> <td style="text-align: center;">4th digit</td> </tr> <tr> <td style="text-align: center;">3rd digit</td> <td style="text-align: center;">2nd digit</td> <td style="text-align: center;">1st digit</td> </tr> </table> </div>	#0054	#0053	#0052	File No.	File No.	File No.				6th digit	5th digit	4th digit	3rd digit	2nd digit	1st digit
#0054	#0053	#0052																
File No.	File No.	File No.																
6th digit	5th digit	4th digit																
3rd digit	2nd digit	1st digit																
	25	Program ROM check	① Check the setting of RAM/ROM changeover switch of memory module and set the switch (to the ROM position). ② Check the setting of EPROM/EEPROM changeover switch of memory module and, if it is improper, set the switch again. ③ Check the setting of system memory #0255 (which selects the ROM operation) and 0256 (which selects the ROM type) and, if it is improper, set the switch again. ④ Check whether the ROM program capacity (setting of system memory #0204 in ROM) is not larger than the program capacity of memory module, and if it exceeds, set the program ROM size again. ⑤ Replace the ROM (in which programs have been written). ⑥ Replace the memory module. ⑦ Replace the control module.															
	26	Data ROM check																
	27	Program ROM size check																
	28	I/O registration table check																
	29	I/O table parity check																

Error item	Value ^(H) of #160	Description	Corrective actions (Execute the operation steps in this sequence and end the action when the normal status has been recovered.)																								
CPU error	32	RAM check (RW)	① Replace the memory module. ② Replace the control module.																								
	33	Parity check																									
	35	Hardware check																									
I/O error	40	Mounted module check	<p>■ When using JW-I/O</p> ① Monitor the system memory #0247. If any value other than 03 ^(H) is set, select the halt mode and write 03 ^(H) at #0247, then start operation. Note 1: If you turn OFF and ON the power supply with the automatic I/O module registration set, the error detection status may change. Therefore, be sure to check it before turning OFF the power supply. ② Monitor the system memory #0046 and obtain the I/O rack, slot where the error has been detected.																								
	41	Input data parity check																									
	42	Output data check																									
	44	I/O data bus																									
	45	I/O signal

			③ Check whether the I/O module of the rack, slot monitored in the above ② has been securely mounted. ④ Check whether the I/O bus expansion adapters (1EA/2EA) of the rack monitored in the above ② has been securely mounted. ⑤ Check whether the setting of the switch of 2EA is proper. (Check the setting of switch No. 0,8 and 9 and check for duplicate set values.) ⑥ Check whether the I/O expansion cables of the rack monitored in the above ② has been securely connected. ⑦ Check whether all the termination plug slot has been properly attached. ⑧ Check whether all the modules and I/O expansion cables have been securely mounted and attached. ⑨ Replace the I/O module checked in the above ③. ⑩ Replace the 1EA/2EA checked in the above ④. ⑪ Replace the I/O expansion cables checked in the above ⑥. ⑫ Replace 1EA. ⑬ Sequentially replace all the JW-2EAs. ⑭ Sequentially replace all the I/O expansion cables. ⑮ Replace the rack panel of the rack monitored in the above ②. ⑯ Replace the control module. ⑰ Replace all the I/O modules sequentially from the one nearest to the control module. ⑱ Replace all the rack panels sequentially from the rack 0. Note 2: If the slot selected at #0048 is the slot of the top module mounted in the rack panel, EA or I/O expansion cable may defective with high possibility.																								

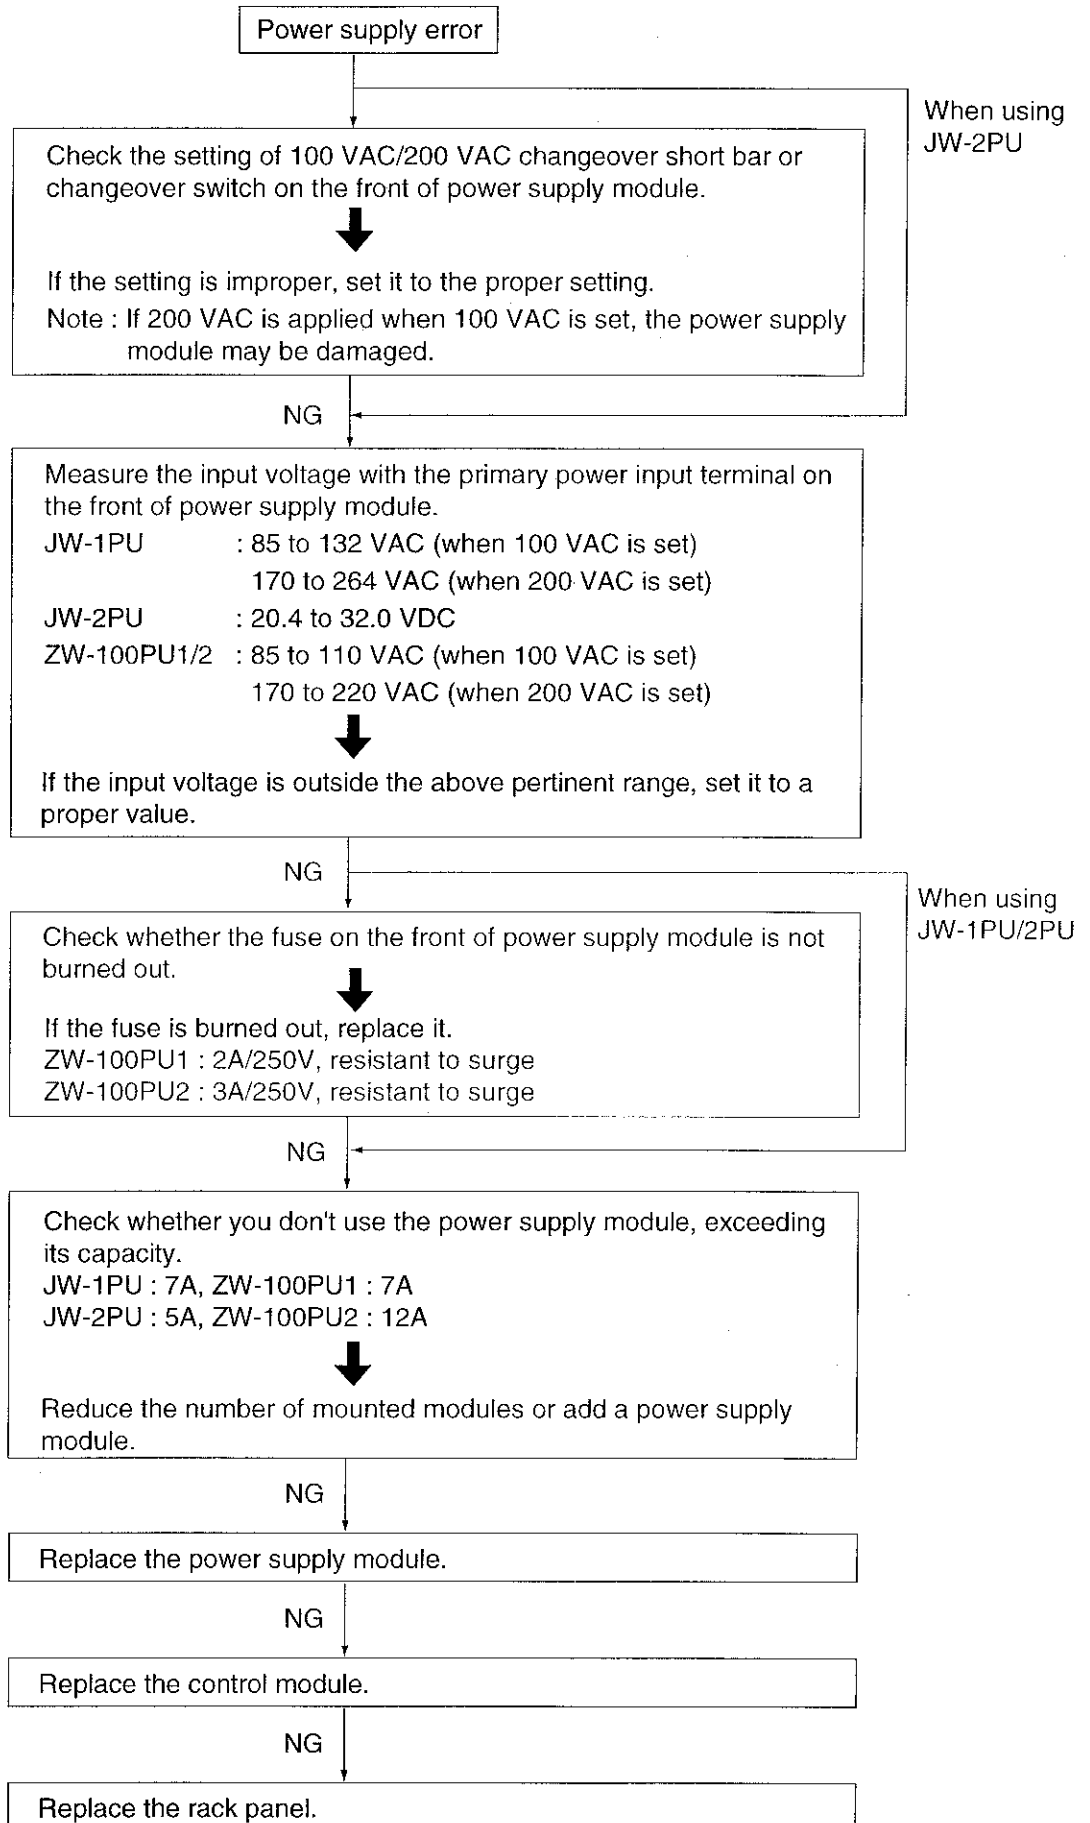

Error Item	Value ^(H) of #160	Description	Corrective actions (Execute the operation steps in this sequence and end the action when the normal status has been recovered.)																		
I/O error			<p>Note 3: When the error code is 40, reset the I/O collation of hand-held programmer (be specifying the rack, slot). Then, if the error does not occur, it can be judged that the I/O module of rack, slot for which I/O collation has been reset had caused the error.</p> <p>Note 4: If you set the live I/O installation/removal, you can replace the I/O module while the power supply is kept turned ON. While the live I/O installation/removal is set, the PC calculation is halted. However, the halt output is kept turned ON (close).</p> <p>[Hand-held programmer key-in procedure]</p> <p>Setting the live I/O installation/removal </p> <p>Resetting the live I/O installation/removal </p>																		
	44	I/O data bus	<p>■ When using JW-I/O</p> <p>① Check the setting of system memory #0250 (total number of bytes used by the I/O module) and, if it is improper, set it again.</p>																		
	45	I/O signal	<p>Note 1: Setting of #0250 is required for the system memory #0252 = 105₍₈₎ (which specifies self-diagnosis of I/O address). When #0252 is set to 000₍₈₎ (which does not specify self-diagnosis of I/O address).execute the following operation step 5 and its subsequent steps.</p> <p>② Monitor the system memory #0046. Then, check whether the I/O module of the I/O address (byte address) where the error has been securely mounted.</p> <div style="text-align: center;"> <table border="1" data-bbox="874 1240 1268 1308"> <tr> <td></td> <td>7</td> <td>6</td> <td>5</td> <td>4</td> <td>3</td> <td>2</td> <td>1</td> <td>0</td> </tr> <tr> <td>#0046</td> <td>2</td> <td>1</td> <td>4</td> <td>2</td> <td>1</td> <td>4</td> <td>2</td> <td>1</td> </tr> </table> <p>Byte address (J0000 to J0037)</p> </div> <p>③ Replace the I/O module mentioned in the above ②.</p> <p>④ Replace the rack panel in which the I/O module mentioned in the above ② has been installed.</p> <p>⑤ Check whether all the module and I/O expansion cables have been securely attached.</p> <p>⑥ When the I/O expansion module (ZW-10EU) is used, check the switch setting and check whether it has been securely mounted.</p> <p>⑦ Sequentially replace the signal cables for system expansion.</p> <p>⑧ When the I/O expansion module (ZW-10EU) is used, replace it.</p> <p>⑨ Replace the control module.</p> <p>⑩ Replace the I/O modules sequentially from that nearest to the control module.</p> <p>⑪ Replace the rack panels sequentially from the basic rack panel.</p> <p>Note 2: If you disconnect the signal cable for system expansion to be connected with the rear-side racks while the power supply module is turned OFF, then turn ON the power supply, you can select only a few possible error causes from among many candidates. (If the error does not occur while the cable is dis-connected, any of the I/O module, rack panel, power supply module or cable may be defective.)</p>		7	6	5	4	3	2	1	0	#0046	2	1	4	2	1	4	2	1

Others			<p>① Check whether any unlimited loop or scan time of the ladder program does not exceed 320ms. If it does, set the PC in the halt mode and modify the ladder program.</p> <p>② When using the remote I/O for JW-10CM/20CM, if you select the mode 0 (specify halting PC when an error has occurred to the slave station), check whether an error (including turning OFF of power supply) has not occurred to the slave station.</p>																	

Check flow 2

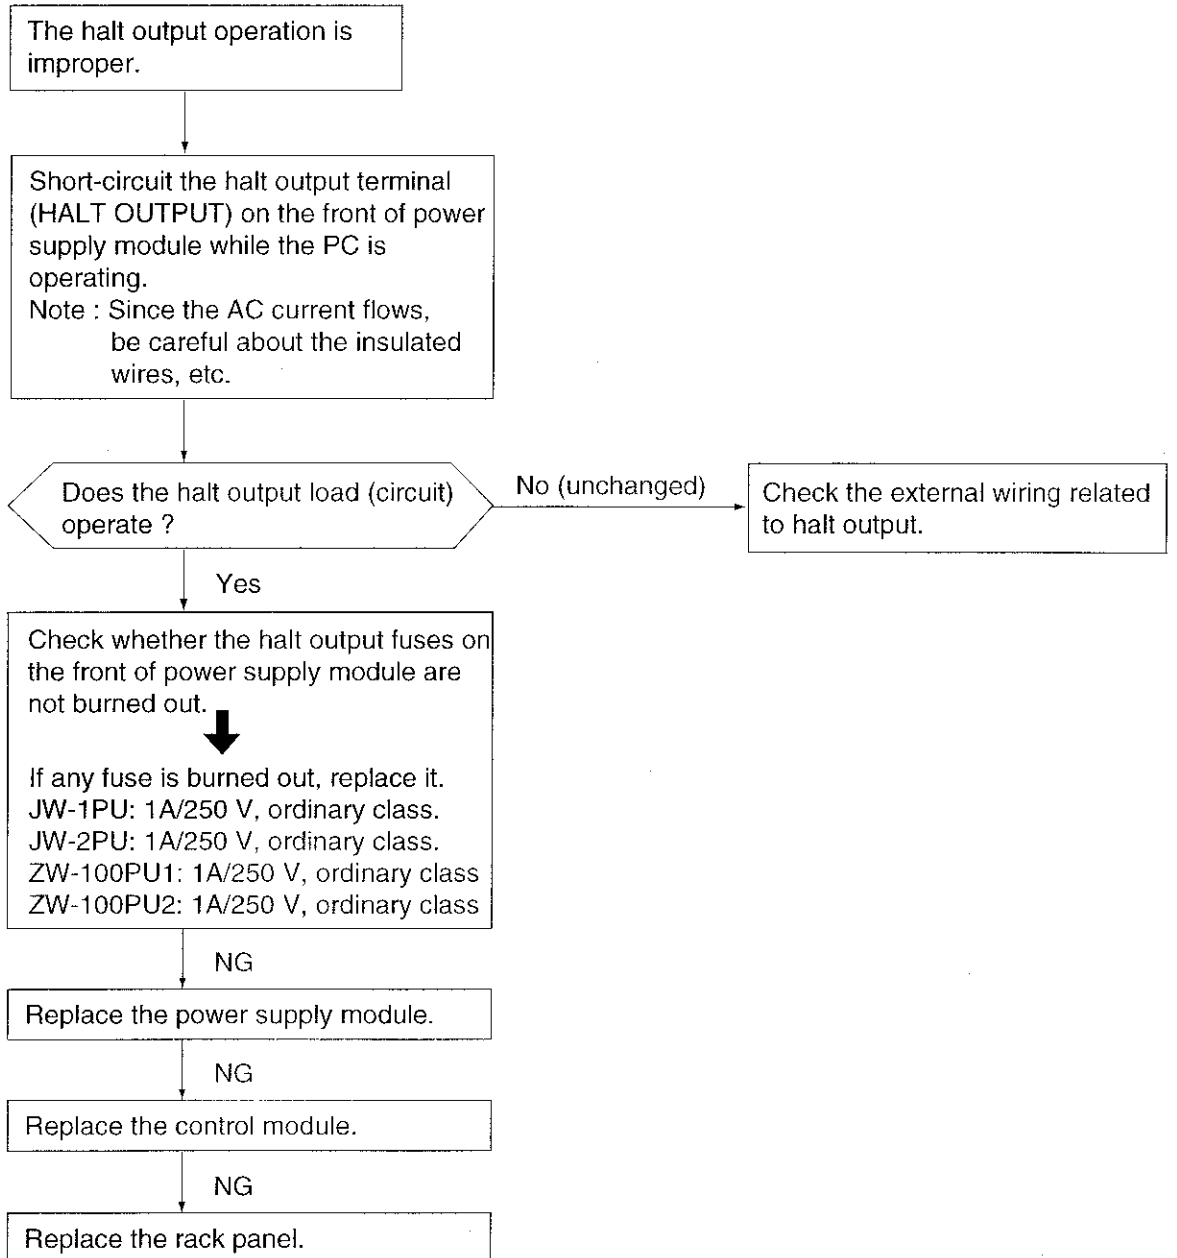

Check flow 3

Check flow 4

Check flow 5

Check flow 6

This flow shows the checking procedure in the event of error of input signal not detected by the self-diagnosis of the control module.

Example of the error

- All inputs of specific input module fail to be turned ON.
- Specific input fails to be turned ON (OFF).
- Among input signals of a same input module, operation of a certain input signal affects other input signal.

Countermeasure: Error input signal

- ① Measure the voltage between the corresponding input terminal of the input module and the common terminal using a tester.
If supply voltage is applied between terminals: ON
If supply voltage is not applied between terminals: OFF
- ② Check the state of LED of input module.
- ③ Connect hand-held programmer, and check ON/OFF by monitoring the data memory (input relay) corresponding to the abnormal input.

[The flow of input signal]

Check flow 7

This flow shows the checking procedure in the event of error of output signal not detected by the self-diagnosis of the control module.

Example of the error

- All inputs of specific output module fail to be turned ON.
(In this case, it is highly possible that the fuse of load power output is melted down.)
- Specific output fails to be turned ON (OFF).
- Among output signals of a same output module, operation of a certain output signal affects other output signal.

Countermeasure: Error output signal

① Connect hand-held programmer, and check ON/OFF by monitoring the data memory (output relay) corresponding to the abnormal output.

② Check the state of LED of output module.

③ Measure the voltage between the corresponding output terminal of the output module and the common terminal using a tester.

When the inter-terminal voltage is output ON voltage (about 1 V or less): ON

When the inter-terminal voltage is load supply voltage: OFF

Note: When the load power source is OFF and wiring to the load is disconnected, it is error if the output is normal.

[The flow of output signal]

Chapter 12. Appendix

12-1 JW series I/O modules specifications

AC input module
JW-11N (100 VAC)

Item	Specifications	Front view
No. of input points	16 points	
Rated input voltage	100 to 120VAC (50/60 Hz)	
Input voltage range	85 to 132 VAC (50/60 Hz), waveform distortion 5% or less)	
Rated input current	10mA[TYP](100 V, 60Hz) 8.4mA[TYP](100V, 50Hz)	
Input impedance	10 kohms [TYP](60Hz), 12 kohms [TYP](50Hz)	
Surge current	Max. 480mA, 0.2ms(at 132 VAC peak ON)	
Input ON level	80 V/7mA or less	
Input OFF level	30 V/3mA or more	
Responsetime (module unit)	OFF to ON: 25 ms or less (100 VAC) ON to OFF: 25 ms or less (100 VAC)	
Internal current consumption (5 VDC)	Max. 57 mA, n points at ON \Rightarrow (25+2n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	20 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1500 VAC for 1 minute (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points	
Weight	Approx. 320g	
Circuit diagram		

DC input module
JW-12N (12/24 VDC, 24 VAC)

Item	Specifications		Front view
No. of input points	16 points		
Rated input voltage	12/24 VDC	24 VAC (50/60Hz)	
Input voltage range	10 to 26.4 VDC *ripple rate: 5% or less at 12 VDC	18 to 26.4 VDC 50/60Hz, waveform distortion 5% or less	
Rated input current	8.4mA[TYP.](24 VDC/AC) 4mA[TYP.](12 VDC)		
Input impedance	2.9 kohms[TYP.]		
Surge current	-		
Input ON level	10 V/3mA or less		
Input OFF level	4.7V/1.5mA or more		
Responsetime (module unit)	OFF to ON: 25 ms or less (12/24 VDC) ON to OFF: 25 ms or less (12/24 VDC)		
Internal current consumption (5 VDC)	Max. 57 mA, n points at ON → (25+2n)mA		
Operation indication	LED lights at ON condition		
External wire connection system	20 P detachable terminal block (M3.5×7 screws)		
Dielectrical strength	1000 VAC for 1 minite (between input terminal and secondary circuit)		
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)		
Insulation system	By photo-coupler		
Common system	1 common line for 8 points		
Weight	Approx. 290g		
Circuit diagram			

AC input module
JW-13N (200 VAC)

Item	Specifications	Front view
No. of input points	16 points	
Rated input voltage	200 to 240VAC (50/60 Hz)	
Input voltage range	170 to 264 VAC (50/60 Hz), waveform distortion 5% or less	
Rated input current	9.1mA[TYP](200 V, 60Hz) 8 mA[TYP](200V, 50Hz)	
Input impedance	25 kohms [TYP](60Hz), 22 kohms [TYP](50Hz)	
Surge current	Max. 500mA, 0.2ms(at 264 VAC peak ON)	
Input ON level	160 V/7mA or less	
Input OFF level	70 V/3mA or more	
Responsetime (module unit)	OFF to ON: 25 ms or less (200 VAC) ON to OFF: 25 ms or less (200 VAC)	
Internal current consumption (5 VDC)	Max. 57 mA, n points at ON → (25+2n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	20 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1500 VAC for 1 minite (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points	
Weight	Approx. 320g	
Circuit diagram		

AC input module
JW-31N (100 VAC)

Item	Specifications	Front view
No. of input points	32 points	
Rated input voltage	100 to 120VAC (50/60 Hz)	
Input voltage range	85 to 132VAC (50/60 Hz), waveform distortion 5% or less)	
Rated input current	10 mA[TYP.](100 V, 60Hz) 8.4mA[TYP.](100V, 50Hz)	
Input impedance	10 kohms [TYP.](60Hz), 12 kohms [TYP.](50Hz)	
Surge current	Max. 480mA, 0.2ms(at 132 VAC peak ON)	
Input ON level	80 V/7mA or less	
Input OFF level	30 V/3mA or more	
Responsetime (module unit)	OFF to ON: 25 ms or less (100 VAC) ON to OFF: 25 ms or less (100 VAC)	
Internal current consumption (5 VDC)	Max. 89 mA, n points at ON → (25+2n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1500 VAC for 1 minite (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points	
Weight	Approx. 420g	
Circuit diagram		

DC input module
JW-32N (12/24 VDC, 24 VAC)

Item	Specifications		Front view
No. of input points	32 points		
Rated input voltage	12/24 VDC	24 VAC (50/60 Hz)	
Input voltage range	10 to 26.4 VDC *ripple rate: 5% or less at 12 VDC	18 to 26.4 VDC 50/60Hz, waveform distortion 5% or less	
Rated input current	8.4 mA[TYP.](24 VDC/AC) 4mA[TYP.](12 VDC)		
Input impedance	2.9 kohms [TYP.]		
Surge current	-		
Input ON level	10 V/3mA or less		
Input OFF level	4.7 V/1.5mA or more		
Responsetime (module unit)	OFF to ON: 25 ms or less (12/24 VDC) ON to OFF: 25 ms or less (12/24 VDC)		
Internal current consumption (5 VDC)	Max. 89 mA, n points at ON → (25+2n)mA		
Operation indication	LED lights at ON condition		
External wire connection system	38 P detachable terminal block (M3.5×7 screws)		
Dielectrical strength	1000 VAC for 1 minite (between input terminal and secondary circuit)		
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)		
Insulation system	By photo-coupler		
Common system	1 common line for 8 points (no common polatiry)		
Weight	Approx. 360g		
Circuit diagram			

DC input module

JW-34N (12/24 VDC High-speed type)

Item	Specifications	Front view
No. of input points	32 points	
Rated input voltage	12/24 VDC	
Input voltage range	10 to 26.4 VDC *ripple rate: 15% or less at 24 VDC *ripple rate: 5% or less at 12 VDC	
Rated input current	8.4 mA[TYP.](24 VDC) 4mA[TYP.](12 VDC)	
Input impedance	2.9 kohms [TYP.]	
Surge current	-	
Input ON level	10 V/3mA or less	
Input OFF level	4.7 V/1.5mA or more	
Responsetime (module unit)	OFF to ON: 0.5 ms or less (12/24 VDC) ON to OFF: 1.5 ms or less (12/24 VDC)	
Internal current consumption (5 VDC)	Max. 89 mA, n points at ON → (25+2n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1000 VAC for 1 minite (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points (no common polatiry)	
Weight	Approx. 380g

DC output module
JW-12S (5/12/24 VDC sink output)

Item	Specifications	Front view
No. of output points	16 points	<p>The front view shows a vertical terminal block with 16 points. The top 8 points are labeled 0 through 7, with a common terminal (COM.) between points 4 and 5. The bottom 8 points are also labeled 0 through 7, with a common terminal (COM.) between points 4 and 5. A fuse indicator window is located at the top right, showing a grid of LEDs labeled 0 through 7, with a common terminal (COM.) between points 4 and 5. The text 'JW-12S' and 'OUTPUT AC:10029V' is printed above the terminal block.</p>
Rated load voltage	5/12/24 VDC	
Load voltage range	4.75 to 32 VDC, with peak voltage less than 40V *Ripple rate 5% or less at 5VDC	
Max. rated load current	1A/point, 8A/common *Note 1	
Allowable surge current	4A (100ms)	
Min. load current	-	
Leakage current at OFF	0.2 mA or less	
Voltage drop at ON	1V or less (1A), ON resistance → Max. 1 ohm	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1 ms or less (resistance load)	
Surge absorber	Zener diode	
Fuse ratings	Class-A, normal blow miniature fuse with 8A rating (One per common) (Using fuse type :MQ2-8A(SOC))	
Fuse blow indication	Fuse indicator comes on and a fuse error signal applied to the control module.	
External power source	4.75 to 30 VDC, 50mA max.	
Internal current consumption (5 VDC)	Max. 121 mA, n points at ON → (25+6n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	20 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1000 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points	
Weight	Approx. 310g	
Circuit diagram	<p>The circuit diagram shows two channels, A and B. Each channel has a power input (Power) connected to a load (Load) through a terminal (+)A and (+)B. The load is connected to the output terminal (0) and a common terminal (COM.A and COM.B). The internal circuit includes a fuse, a FET, a photo-coupler, and an output indicator. A fuse blown detection circuit is also shown.</p> <p>Note 1: For an inductive load drawing a load current of more than 0.5A, the output switching rate should not exceed 30 times/minute (on for one second, off for one second). If this rate is exceeded, a counter-electromotive force absorber is required across the load. For an inductive load drawing a load current of more than 0.6A, be sure to use a counter-electromotive force absorber across the load. Up to 2A of load current can be driven by paralleling more than one output (for more details, see page 4-61.)</p>	

AC output module
JW-13S (100/200 VAC)

Item	Specifications	Front view
No. of output points	16 points	
Rated load voltage	100 to 240 VAC (50/60Hz)	
Load voltage range	15 to 264 VAC(50/60 Hz, with ripple less than 5%) [Note] For a load voltage of 85 VAC or less, fuse failure may not be detectable.	
Max. rated load current	2A/point, 4A/common	
Allowable surge current	6A (100ms)	
Min. load current	10mA *Note 1	
Leakage current at OFF	1.5 mA or less (120 VAC), 3mA or less (240 VAC)	
Voltage drop at ON	2V or less (2A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: A half cycle of load power+ 1ms or less	
Surge absorber	CR absorber, varistor	
Fuse ratings	Class-A, normal blow miniature fuse with 4A rating (One per common) (Using fuse type :MQ4-4A(made by SOC))	
Fuse blow indication	Fuse indicator comes on and a fuse error signal applied to the control module.	
External power source	-	
Internal current consumption (5 VDC)	Max. 265 mA, n points at ON ➡ (25+15n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	20 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points	
Weight	Approx. 530g	
Circuit diagram	<p>Note 1: For a load current less than the minimum load current of 10mA, the output circuit may fail to turn OFF depending on the load characteristics. In such a case, use a bleeder resistor in parallel with the load to make the load current exceed 10 mA.</p>	

DC output module
JW-32S (5/12/24 VDC sink output)

Item	Specifications	Front view
No. of output points	32 points	
Rated load voltage	5/12/24 VDC	
Load voltage range	4.75 to 30 VDC with peak voltage less than 40V *Ripple rate 5% or less at 5VDC	
Max. rated load current	1A/point, 8A/common *Note 1	
Allowable surge current	4A (100ms)	
Min. load current	-	
Leakage current at OFF	0.2 mA or less	
Voltage drop at ON	1V or less (1A), ON resistance → Max. 1 ohm	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1ms or less (resistance load)	
Surge absorber	Zener diode	
Fuse ratings	Class-A, normal blow miniature fuse with 8A rating (One per common) (Using fuse type :MQ2-8A(made by SOC))	
Fuse blow indication	Fuse indicator comes on and a fuse error signal applied to the control module.	
External power source	4.75 to 30 VDC, 100 mA max.	
Internal current consumption (5 VDC)	Max. 217 mA, n points at ON → (25+6n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1000 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points	
Weight	Approx. 390g	
Circuit diagram	<p>Note 1: For an inductive load drawing a load current of more than 0.3A, the output switching rate should not exceed 30 times/minute (on for one second, off for one second). If this rate is exceeded, a counter-electromotive-force absorber is required across the load. For an inductive load drawing a load current of more than 0.5A, be sure to use a counter-electromotive force absorber across the load.</p>

AC output module
JW-33S (100/200 VAC)

Item	Specifications	Front view
No. of output points	32 points	
Rated load voltage	100 to 240 VAC(50/60Hz)	
Load voltage range	15 to 264 VAC(50/60 Hz, with ripple less than 5%) [Note] For a load voltage of 85 VAC or less, fuse failure may not be detectable.	
Max. rated load current	1A/point, 4A/common	
Allowable surge current	6A (100ms)	
Min. load current	10mA *Note 1	
Leakage current at OFF	1.5 mA or less(120 VAC), 3mA or less(240 VAC)	
Voltage drop at ON	2V or less (1A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: A half cycle of load power+ 1ms or less	
Surge absorber	CR absorber, varistor	
Fuse ratings	Class-A, normal blow miniature fuse with 4A rating (One per common) (Using fuse type :MQ4-4A(made by SOC))	
Fuse blow indication	Fuse indicator comes on and a fuse error signal applied to the control module.	
External power source	-	
Internal current consumption (5 VDC)	Max. 505 mA, n points at ON → (25+15n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5X7 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points	
Weight	Approx. 600g	
Circuit diagram	<p>Note 1: For a load current less than the minimum load current of 10mA, the output circuit may fail to turn OFF depending on the load characteristics. In such a case, use a bleeder resistor in parallel with the load to make the load current exceed 10 mA.</p>	

Relay output module
JW-34S (264 VAC/30 VDC)

Item		Specifications	Front view
No. of output points		32 points	
Rated load voltage		264 VAC/30 VDC, 2A(resistance load), 5A/common	
Minimum load		5 VDC, 1mA	
Operation life	Mechanical	More than 20,000,000 operations	
	Electrical (see life curve)	1. Resistance load at max. switching voltage and current : More than 100,000 operations	
		2. Inductive load with 250 VAC, 0.5A rating (COS φ =0.4) : More than 300,000 operations	
		3. Inductive load with 30 VDC , 0.5A(T=7ms) : More than 300,000 operations	
Response time (module unit)		OFF to ON: 10 ms or less ON to OFF: 10 ms or less	
Surge absorber		None	
Fuse ratings		No fuse	
Fuse blow indication		None	
External power source		24 VDC ± 10% with peak voltage less than 30 V, ripple not exceeding 10%, and max. current 400mA	
Internal current consumption (5 VDC)		Max. 217 mA , n points at ON → (25+6n)mA	
Operation indication		LED lights at ON condition	
External wire connection system		38 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength		1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance		500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system		By photo-coupler	
Common system		1 common line for 8 points	
Weight		Approx. 450g	
Circuit diagram			

DC output module

JW-62SC (5/12/24 VDC, connector connection, sink output)

Item	Specifications	Front view																																																																																			
No. of output points	64 points *Note 2																																																																																				
Rated load voltage	5/12/24 VDC																																																																																				
Load voltage range	4.75 to 30 VDC with peak voltage less than 35V *Ripple rate 10% or less at 12/24 VDC *Ripple rate 5% or less at 5 VDC																																																																																				
Max. rated load current	0.1A/point, 1.6A/common *Note 2																																																																																				
Allowable surge current	0.12A (100ms)																																																																																				
Min. load current	-																																																																																				
Leakage current at OFF	0.2 mA or less																																																																																				
Voltage drop at ON	1.3V or less (0.1A)																																																																																				
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1ms or less (resistance load)																																																																																				
Surge absorber	Zener diode																																																																																				
Fuse ratings	No fuse																																																																																				
Fuse blow indication	None																																																																																				
External power source	-																																																																																				
Internal current consumption (5 VDC)	Max. 650 mA, n points at ON → $(28+12.6n_1+6.6n_2)$ mA *Note 2																																																																																				
Operation indication	LED lights at ON condition (switchable in 32-point increments)																																																																																				
External wire connection system	40 P connector (soldering) (applicable wire size: 0.3mm ² or less)																																																																																				
Dielectrical strength	1000 VAC for 1 minute (between output terminal and secondary circuit)																																																																																				
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)																																																																																				
Insulation system	By photo-coupler																																																																																				
Common system	1 common line for 16 points																																																																																				
Weight	Approx. 500g

<p>Note 1: n₁ is the number of lamp ON points and n₂ is the number of lamp OFF points.</p> <p>Note 2: The maximum number of consecutive ON points that can be used simultaneously with each common (16 points) at a temperature of 45 to 50 degrees is 16 points) at a temperature of 45 to 50 degrees is 16 points for a load current of 70mA, and 12 points for a load current of 70mA, and 12 points for a load current of 100mA.</p>																																																																																					

DC output module

JW-35S (12/24 VDC source output)

Item	Specifications	Front view
No. of output points	32 points	<p>The front view shows a vertical terminal block with 32 points. It is divided into four groups: Group A (pins 0-7), Group B (pins 0-7), Group C (pins 0-7), and Group D (pins 0-7). Each group has a common terminal labeled 'COM.AB (-)AB', 'COM.CD (-)CD', etc. There are also two circular indicators at the top and bottom of the terminal block.</p>
Rated load voltage	12/24 VDC	
Load voltage range	10 to 30 VDC with peak voltage less than 40V	
Max. rated load current	1A/point, 8A/common *Note 1	
Allowable surge current	4A(100ms)	
Min. load current	-	
Leakage current at OFF	0.2mA or less	
Voltage drop at ON	1.5V or less (1A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1 ms or less (resistance load)	
Surge absorber	Zener diode	
Fuse ratings	Class-A, normal blow miniature fuse with 8A rating (One per common) (Using fuse type :MQ2-8A(made by SOC))	
Fuse blow indication	Fuse indicator comes on and a fuse error signal applied to the control module.	
External power source	10 to 30 VDC, 300mA max.	
Internal current consumption (5 VDC)	Max. 217 mA, n points at ON → (25+6n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×7 screws)	
Dielectrical strength	1000 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points	
Weight	Approx. 400g	
Circuit diagram	<p>The circuit diagram shows two channels, A and B. Each channel has a power input (+ and -) connected to a common terminal (COM.AB and COM.CD). The positive terminal goes through a fuse and a fuse blown detection circuit. The negative terminal goes through an internal circuit and a photo-coupler. The output of the photo-coupler is connected to an output indicator. External loads are connected to the output terminals (0-7).</p> <p>Note 1: For an inductive load drawing a load current of more than 0.3A, the output switching rate should not exceed 30 times/minute (on for one sec., off for one sec.). If this rate is exceeded, a counter-electromotive-force absorber is required across the load. For an inductive load drawing a load current of more than 0.5A, be sure to use a counter-electromotive force absorber across the load.</p>	

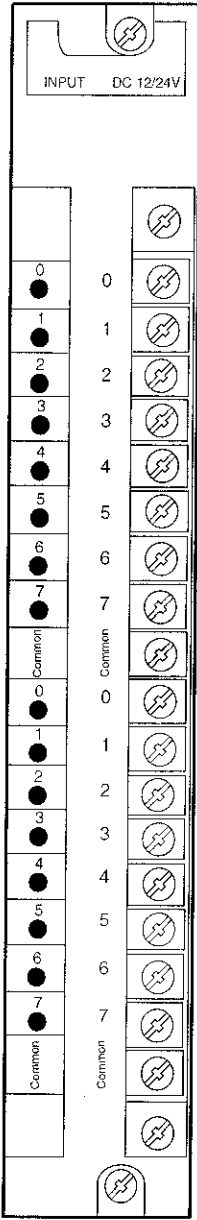

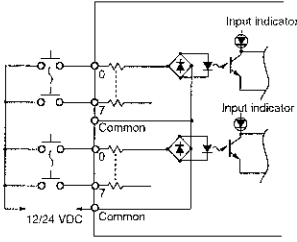

12-2 ZW series I/O modules specifications

AC input module
ZW-16N1(100 VAC)

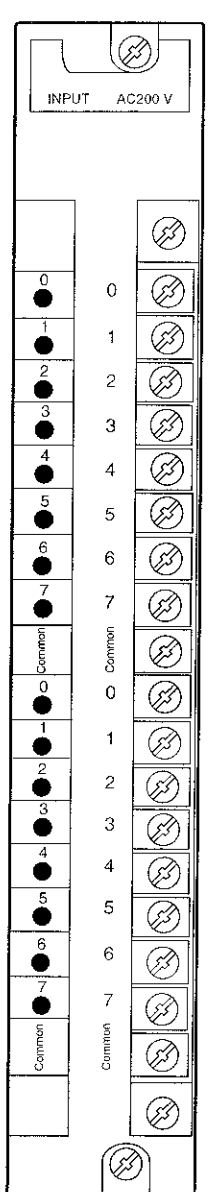

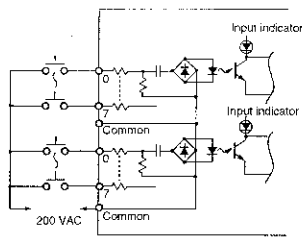

Item	Specifications	Front view
No. of input points	16 points	
Rated input voltage	100 to 110VAC (50/60 Hz)	
Input voltage range	85 to 121 VAC (50/60 Hz), waveform distortion 5% or less)	
Rated input current	12mA[TYP](100 VAC, 60Hz) 10mA[TYP](100VAC, 50Hz)	
Input impedance	8 kohms [TYP](60Hz), 9.7 kohms [TYP](50Hz)	
Surge current	Max. 365mA, 0.4ms(at 121 VAC peak ON)	
Input ON level	80 V/9.5mA or less	
Input OFF level	30 V/3mA or more	
Responsetime (module unit)	OFF to ON: 15 ms or less (100 VAC) ON to OFF: 20 ms or less (100 VAC)	
Internal current consumption (5 VDC)	Max. 120 mA, n points at ON → (50+4.4n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	18 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points	
Weight	Approx. 600g	
Circuit diagram		

Front view with I/O module cover removed

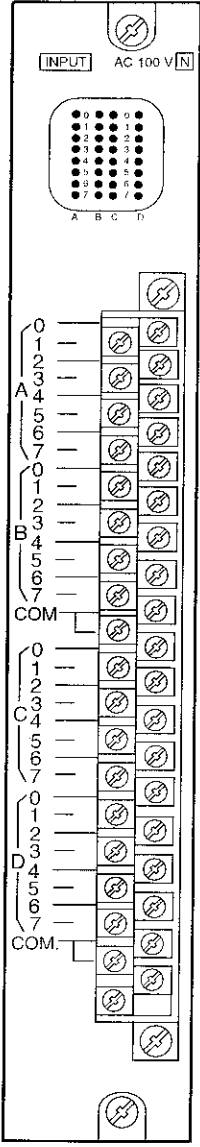

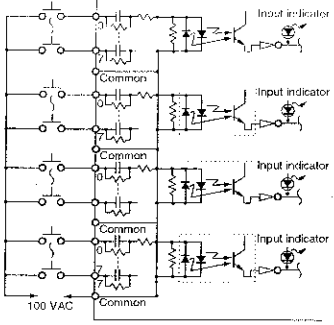

DC input module
ZW-16N2 (12/24 VDC)

Item	Specifications		Front view
No. of input points	16 points		 <p>Front view with I/O module cover removed.</p>
Rated input voltage	12/24 VDC	24 VAC (50/60 Hz)	
Input voltage range	11 to 30 VDC *ripple rate: 10% or less at 12 VDC	20 to 28 VDC 50/60Hz, waveform distortion 5% or less	
Rated input current	12mA[TYP](24 VDC)	5mA[TYP](12 VDC)	
Input impedance	2 kohms [TYP]		
Surge current	-		
Input ON level	10 V/4 mA or less		
Input OFF level	3.6 V/1.5 mA or more		
Responsetime (module unit)	OFF to ON: 15 ms or less (12/24 VDC) ON to OFF: 20 ms or less (12/24 VDC)		
Internal current consumption (5 VDC)	Max. 120 mA, n points at ON → (50+4.4n)mA		
Operation indication	LED lights at ON condition		
External wire connection system	18 P detachable terminal block (M3.5×8 screws)		
Dielectrical strength	1500 VAC for 1 minite (between input terminal and secondary circuit)		
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)		
Insulation system	By photo-coupler		
Common system	1 common line for 16 points (no common polatiry)		
Weight	Approx. 500g		
Circuit diagram			

AC input module
ZW-16N3 (200 VAC)

Item	Specifications	Front view
No. of input points	16 points	 <p>Front view with I/O module cover removed.</p>
Rated input voltage	200 to 220VAC (50/60 Hz)	
Input voltage range	170 to 242 VAC (50/60 Hz, waveform distortion 5% or less)	
Rated input current	11mA[TYP](200 VAC, 60Hz), 9mA[TYP](200 VAC, 50Hz)	
Input impedance	17.7 kohms [TYP](60Hz), 21.2 kohms [TYP](50Hz)	
Surge current	Max. 342mA, 0.4ms(at 242 VAC peak ON)	
Input ON level	160 V/8.5mA or less	
Input OFF level	60 V/3.5mA or more	
Responsetime (module unit)	OFF to ON: 15 ms or less (200 VAC) ON to OFF: 20 ms or less (200 VAC)	
Internal current consumption (5 VDC)	Max. 120 mA, n points at ON → (50+4.4n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	18 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points	
Weight	Approx. 600g	
Circuit diagram		

AC input module
ZW-32N1T (100 VAC)

Item	Specifications	Front view
No. of input points	32 points	 <p data-bbox="1193 1509 1385 1532">Terminal block with cover</p>
Rated input voltage	100 to 110VAC (50/60 Hz)	
Input voltage range	85 to 121 VAC (50/60 Hz, waveform distortion 5% or less)	
Rated input current	10mA[TYP](100 VAC, 60Hz), 8.5mA[TYP](100 VAC, 50Hz)	
Input impedance	9.8 kohms [TYP](60Hz), 11.8 kohms [TYP](50Hz)	
Surge current	Max. 440mA, 0.2ms (at 121 VAC peak ON)	
Input ON level	80 V/7 mA or less	
Input OFF level	30 V/3 mA or more	
Responsetime (module unit)	OFF to ON: 15 ms or less (100 VAC) ON to OFF: 20 ms or less (100 VAC)	
Internal current consumption (5 VDC)	Max. 200 mA, n points at ON → (75+3.9n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohm or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 32 points	
Weight	Approx. 700g	
Circuit diagram		

Data input module
ZW-32N2 (12/24 VDC)

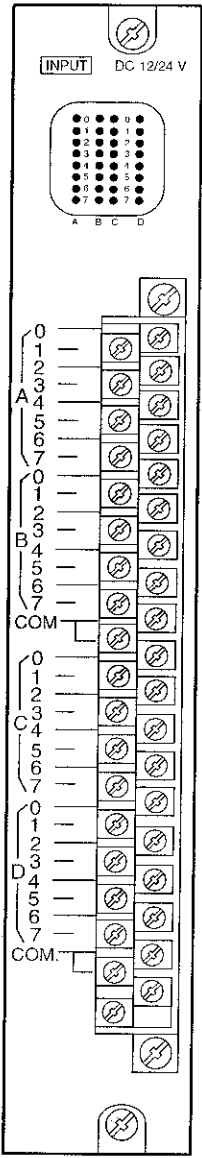

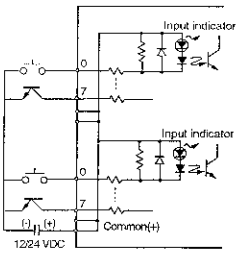

Item	Specifications	Front view
No. of input points	32 points	
Rated input voltage	12/24 VDC	
Input voltage range	11 to 26.4 VDC *Ripple rate: 15% or less at 24 VDC *Ripple rate: 5% or less at 12 VDC	
Rated input current	9.5 mA[TYP.](24 VDC) 3.5mA[TYP.](12 VDC)	
Input impedance	2.5 kohms [TYP.]	
Surge current	-	
Input ON level	10 V/3 mA or less	
Input OFF level	6 V/15 mA or more	
Responsetime (module unit)	OFF to ON: 15 ms or less (12/24 VDC) ON to OFF: 20 ms or less (12/24 VDC)	
Internal current consumption (5 VDC)	Max. 95 mA	
Operation indication	LED lights at ON condition	
External wire connection system	40 P connector (soldering) (applicable wire size: 0.3mm ² or less)	
Dielectrical strength	1500 VAC for 1 minute (between input terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between input terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 32 points (+ common)	
Weight	Approx. 500g

AC output module
ZW-8S1 (100 VAC)

Item	Specifications	Front view
No. of output points	8 points	
Rated load voltage	100 to 110 VAC (50/60Hz)	
Load voltage range	15 to 121 VAC(50/60 Hz, with ripple less than 5%)	
Max. rated load current	2A/point, 5A/common	
Allowable surge current	8A (100ms)	
Min. load current	30mA *Note 1	
Leakage current at OFF	2 mA or less	
Voltage drop at ON	2V or less (2A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: A half cycle of load power+ 1ms or less	
Surge absorber	CR absorber, varistor	
Fuse ratings	Class-B, normal blow miniature fuse with 5A rating (One per common) (Using fuse type :FGMB-5A/125V(Fuji Tanshi)	
Fuse blow indication	None	
External power source	-	
Internal current consumption (5 VDC)	Max. 240 mA, n points at ON ➔ (80+20n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	18 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 4 points	
Weight	Approx. 800g	
Circuit diagram	<p>Note 1: For a light load drawing less than the minimum load current of 30mA, the output circuit may fail to turn OFF depending on the load characteristics. In such a case, use a bleeder resistor in parallel with the load to make the load current exceed 30mA.</p>	

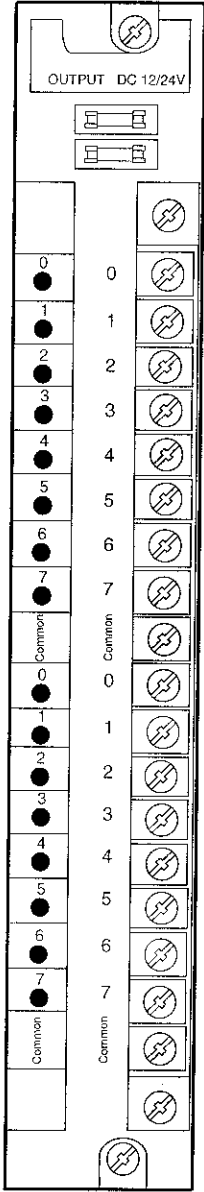

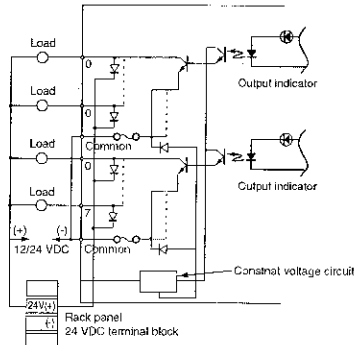

DC output module
ZW-8S2 (12/24 VDC)

Item	Specifications	Front view
No. of output points	8 points	 <p>OUTPUT AC 12/24V</p> <p>SA</p> <p>0 1 2 3 4 5 6 7</p> <p>Common (-) Common (-)</p> <p>Front view with I/O module cover removed.</p>
Rated load voltage	12/24 VDC	
Load voltage range	10 to 30 VDC with peak voltage less than 47V	
Max. rated load current	2A/point, 5A/common	
Allowable surge current	4A (100ms)	
Min. load current	-	
Leakage current at OFF	0.1 mA or less	
Voltage drop at ON	2V or less (2A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1 ms or less (resistance load)	
Surge absorber	Flywheel diode	
Fuse ratings	Class-B, normal blow miniature fuse with 5A rating (One per common) (Using fuse type :FGMB-5A/125V(Fuji Tanshi))	
Fuse blow indication	None	
External power source	10 to 30 VDC, 40mA max.	
Internal current consumption (5 VDC)	Max. 160 mA, n points at ON → (80+10n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	18 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 4 points (commons are insulated from each other by diodes.)	
Weight	Approx. 800g

AC output module
ZW-16S3 (100/200 VAC)

Item	Specifications	Front view
No. of output points	16 points	
Rated load voltage	100 to 220 VAC (50/60Hz)	
Load voltage range	15 to 242 VAC(50/60 Hz, with ripple less than 5%)	
Max. rated load current	2A/point, 5A/common	
Allowable surge current	8A (100ms)	
Min. load current	- *Note 1	
Leakage current at OFF	3 mA or less	
Voltage drop at ON	2V or less (2A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: A half cycle of load power+ 1ms or less	
Surge absorber	CR absorber, varistor	
Fuse ratings	Class-B, normal blow miniature fuse with 5A rating (One per common) (Using fuse type :FGMB-5A/125V(Fuji Tanshi)	
Fuse blow indication	None	
External power source	-	
Internal current consumption (5 VDC)	Max. 400 mA, n points at ON → (80+20n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	18 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 4 points	
Weight	Approx. 800g	
Circuit diagram	<p>Note 1: No limitation exists for the minimum operating current. Note the leakage current.</p>	

Relay output module
ZW-16S4 (240 VAC/30 VDC)

Item		Specifications	Front view
No. of output points		16 points	 <p>Front view with I/O module cover removed.</p>
Rated load voltage		240 VAC/30 VDC, 2A(resistance load), 5A/common	
Minimum load		5 VDC, 1mA	
Operation life	Mechanical	More than 20,000,000 operations	
	Electrical (see life curve)	1. Resistance load at max. switching voltage and current : More than 100,000 operations	
		2. Inductive load with 250 VAC, 0.5A rating (COS ϕ =0.4) : More than 300,000 operations	
		3. Inductive load with 30 VDC , 0.5A(T=7ms) : More than 300,000 operations	
Response time (module unit)		OFF to ON: 15 ms or less ON to OFF: 20 ms or less	
Surge absorber		None	
Fuse ratings		Flash miniature fuse with 5A rating (one for each common) (Using fuse type : TSC-5A/250 VAC from SOC)	
Fuse blow indication		None	
External power source		24 VDC \pm 10% with peak voltage less than 42 V, and max. current 320 mA	
Internal current consumption (5 VDC)		Max. 180 mA , n points at ON \Rightarrow (85+6n)mA	
Operation indication		LED lights at ON condition	
External wire connection system		18 P detachable terminal block (M3.5 \times 8 screws)	
Dielectrical strength		1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance		500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system		By photo-coupler	
Common system		1 common line for 8 points	
Weight		Approx. 600g	
Circuit diagram			

Relay output module
ZW-16S4D (240 VAC/30 VDC)

Item		Specifications	Front view
No. of output points		16 points	<p>Terminal block with cover</p>
Rated load voltage		250 VAC/30 VDC, 2A(resistance load)	
Minimum load		5 VDC, 1mA	
Operation life	Mechanical	More than 10,000,000 operations	
	Electrical (see life curve)	1. Resistance load at max. switching voltage and current : More than 100,000 operations	
		2. Inductive load with 250 VAC, 0.5A rating (COS ϕ =0.4) : More than 300,000 operations	
		3. Inductive load with 30 VDC , 0.5A(T=7ms) : More than 300,000 operations	
Response time (module unit)		OFF to ON: 15 ms or less ON to OFF: 20 ms or less	
Surge absorber		None	
Fuse ratings		No fuse	
Fuse blow indication		-	
External power source		24 VDC \pm 10% with peak voltage less than 30 V, ripple not exceeding 10%, and max. current 320 mA	
Internal current consumption (5 VDC)		Max. 80 mA , n points at ON \rightarrow (20+8n) mA	
Operation indication		LED lights at ON condition	
External wire connection system		38 P detachable terminal block (M3.5 \times 8 screws)	
Dielectrical strength		1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance		500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system		By photo-coupler	
Common system		Independent common for each output point	
Weight		Approx. 700g	
Circuit diagram			

AC output module
ZW-32S1T (100 VAC)

Item	Specifications	Front view
No. of output points	32 points	
Rated load voltage	100 to 110 VAC (50/60Hz)	
Load voltage range	15 to 121 VAC(50/60 Hz, with ripple less than 5%)	
Max. rated load current	0.6A/point, 2.4A/common	
Allowable surge current	6A (100ms)	
Min. load current	10 mA *Note 1, Note 2	
Leakage current at OFF	2 mA or less	
Voltage drop at ON	6.6V or less (0.6A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: A half cycle of load power+ 1ms or less	
Surge absorber	Capacitive varistor	
Fuse ratings	Shut OFF alarm fuse with 3.2A rating (One for each common) (Using fuse type :HP-32 (Daito Comm.))	
Fuse blow indication	LED comes on if a fuse failure occur.	
External power source	-	
Internal current consumption (5 VDC)	Max. 600 mA, n points at ON ➔ $(85+16.1n)$ mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 8 points	
Weight	Approx. 800g	
Circuit diagram	<p>Note 1: For a light load drawing less than the minimum load current of 10 mA, the output circuit may fall to turn OFF depending on the load characteristics. In such a case, use a bleeder resistor in parallel with the load to make the load current exceed 10mA.</p> <p>Note 2: The minimum load current differs depending on module type : OUTPUT 100 VAC(N): 10 mA (current model) OUTPUT 100 VAC : 50 mA</p>	

Data output module
ZW-32S2 (5/12/24 VDC)

Item	Specifications	Front view																																																																																				
No. of output points	32 points																																																																																					
Rated load voltage	5/12/24 VDC																																																																																					
Load voltage range	4.75 to 30 VDC with peak voltage less than 47V *Ripple rate 5% or less at 5VDC																																																																																					
Max. rated load current	0.5A/point, 5A/group of 16 points; 0.1A/point for 5VDC																																																																																					
Allowable surge current	2A (100ms) *Note 1																																																																																					
Min. load current	-																																																																																					
Leakage current at OFF	0.1 mA or less

Data output module
ZW-32S2T (5/12/24 VDC)

Item	Specifications	Front view
No. of output points	32 points	
Rated load voltage	5/12/24 VDC	
Load voltage range	4.75 to 30 VDC with peak voltage less than 47V *Ripple rate 5% or less at 5VDC	
Max. rated load current	0.5A/point, 5A/common	
Allowable surge current	2A (100ms) *Note 1	
Min. load current	-	
Leakage current at OFF	0.1 mA or less	
Voltage drop at ON	1V or less (0.5A), 0.3V or less (0.1A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1ms or less (resistance load)	
Surge absorber	Flywheel diode	
Fuse ratings	Shut OFF alarm fuse with 5A rating (one for each common) (Using fuse type :HP-50 (made by Daito Comm.))	
Fuse blow indication	LED comes on if a fuse failure occur.	
External power source	4.5 to 30 VDC, 160 mA max.	
Internal current consumption (5 VDC)	Max. 320 mA, n points at ON ➔ (100+6.9n)mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points (commons are insulated from each other by diodes.)	
Weight	Approx. 800g	
Circuit diagram	<p>Note 1: For a surge current of more than 1A, it may be limited by output devices.</p>	

Data output module
ZW-32S2TD (5/12/24 VDC)

Item	Specifications	Front view
No. of output points	32 points	
Rated load voltage	5/12/24 VDC	
Load voltage range	4.75 to 30 VDC with peak voltage less than 47V *Ripple rate 5% or less at 5VDC	
Max. rated load current	0.5A/point, 5A/common *Note 1	
Allowable surge current	2A (100ms) *Note 2	
Min. load current	-	
Leakage current at OFF	0.1 mA or less	
Voltage drop at ON	1V or less (0.5A), 0.3V or less(0.1A)	
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1ms or less (resistance load)	
Surge absorber	Zener diode (TYP51V)	
Fuse ratings	Shut OFF alarm fuse with 5A rating (one for each common) (Using fuse type :HP-50 (made by Daito Comm.))	
Fuse blow indication	LED comes on if a fuse failure occur.	
External power source	4.5 to 30 VDC, 160 mA max.	
Internal current consumption (5 VDC)	Max. 320 mA, n points at ON ➔ $(100+6.9n)$ mA	
Operation indication	LED lights at ON condition	
External wire connection system	38 P detachable terminal block (M3.5×8 screws)	
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system	By photo-coupler	
Common system	1 common line for 16 points (each common completely isolated in 16 units)	
Weight	Approx. 700g	
Circuit diagram	<p>Note 1: For an inductive load drawing a load current of more than 0.3A, the output switching rate should not exceed 30 times/minute (on for one sec., off for one sec.). If this rate is exceeded, a counter-electromotive force absorber is required across the load.</p> <p>Note 2: For a surge current of more than 1A, it may be limited by output devices.</p>	<p>Terminal block with cover.</p>

Relay output module
ZW-32S4T (240 VAC/30 VDC)

Item		Specifications	Front view
No. of output points		32 points	
Rated load voltage		240 VAC/30 VDC, 2A(resistance load), 5A/commom	
Minimum load		5 VDC, 1mA	
Operation life	Mechanical	More than 20,000,000 operations	
	Electrical (see life curve)	1. Resistance load at max. switching voltage and current : More than 100,000 operations	
		2. Inductive load with 250 VAC, 0.5A rating (COS ϕ =0.4) : More than 300,000 operations	
		3. Inductive load with 30 VDC , 0.5A(T=7ms) : More than 300,000 operations	
Response time (module unit)		OFF to ON: 15 ms or less ON to OFF: 12 ms or less	
Surge absorber		None	
Fuse ratings		No fuse	
Fuse blow indication		None	
External power source		24 VDC \pm 10% with peak voltage less than 30 V, ripple not exceeding 10%, and max. current 320 mA	
Internal current consumption (5 VDC)		Max. 220 mA , n points at ON \rightarrow (100+3.7n) mA	
Operation indication		LED lights at ON condition	
External wire connection system		38 P detachable terminal block (M3.5 \times 8 screws)	
Dielectrical strength		1500 VAC for 1 minite (between output terminal and secondary circuit)	
Insulation resistance		500 VDC, 10M ohms or more (between output terminal and secondary circuit)	
Insulation system		By photo-coupler	
Common system		1 common line for 8 points	
Weight		Approx. 800g

Min. load current	-																																																																																				
Leakage current at OFF	0.1 mA or less																																																																																				
Voltage drop at ON	1V or less																																																																																				
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1ms or less (resistance load) *Note 1																																																																																				
Surge absorber	Flywheel diode																																																																																				
Fuse ratings	Class-B, normal blow miniature fuse with 5A rating (One for each group of 16 points) (Using fuse type :FGMB5A/125V(made by Fuji Tanshi))																																																																																				
Fuse blow indication	None																																																																																				
External power source	4.75 to 30 VDC, 500 mA max.																																																																																				
Internal current consumption (5 VDC)	Max. 185 mA, n points at ON ➔ (85+3.1n)mA																																																																																				
Operation indication	LED lights at ON condition																																																																																				
External wire connection system	40-pin connector (soldering) (Applicable wire size: 0.3mm ² or less)																																																																																				
Dielectrical strength	1500 VAC for 1 minute (between output terminal and secondary circuit)																																																																																				
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)																																																																																				
Insulation system	By photo-coupler																																																																																				
Common system	1 common line for 32 points (No. of common pins: 4)																																																																																				
Weight	Approx. 600g

Data output module
ZW-64S2 (5/12/24 VDC)

Item	Specifications	Front view																																																																																				
No. of output points	64 points	<p>OUTPUT DC 5/12/24V</p> <p>Front view with I/O module cover removed.</p>																																																																																				
Rated load voltage	5/12/24 VDC																																																																																					
Load voltage range	4.75 to 30 VDC with peak voltage less than 35V *Ripple rate 5% or less at 5 VDC																																																																																					
Max. rated load current	0.1A/point																																																																																					
Allowable surge current	0.4A (10ms)																																																																																					
Min. load current	-																																																																																					
Leakage current at OFF	0.1 mA or less																																																																																					
Voltage drop at ON	2V or less (0.1A)																																																																																					
Response time (module unit)	OFF to ON: 1 ms or less ON to OFF: 1ms or less (resistance load)																																																																																					
Surge absorber	Zener diode																																																																																					
Fuse ratings	2A (not change) 1 common																																																																																					
Fuse blow indication	None																																																																																					
External power source	4.75 to 30 VDC, 96 mA max.																																																																																					
Internal current consumption (5 VDC)	Max. 650 mA, n points at ON $\rightarrow (80+7.0n_1+3.0n_2)$ mA *Note 1																																																																																					
Operation indication	LED lights at ON condition (switchable in 32-point increments)																																																																																					
External wire connection system	40 P connector \times 2 (soldering)																																																																																					
Dielectrical strength	1500 VAC for 1 minite (between output terminal and secondary circuit)																																																																																					
Insulation resistance	500 VDC, 10M ohms or more (between output terminal and secondary circuit)																																																																																					
Insulation system	By photo-coupler																																																																																					
Common system	1 common line for 16 points (each common completely isolated in 16 units)																																																																																					
Weight	Approx. 800g																																																																																					
Circuit diagram	<p>Note 2</p>

DC I/O module
ZW-32IO2 (5/12/24 VDC)

Item	Specifications	Front view	
Rated load voltage	5/12/24 VDC *Note 1	<p>The front view shows a vertical module with a 40-pin connector. The top section is labeled 'I/O 5/12/24VDC'. Below it is a fuse labeled '2A 300mA' with 'Upper' and 'Lower' terminals. The connector has two columns of pins: 'IN' (pins 0-7) and 'OUT' (pins 0-7). A 'Common' line is indicated between the two columns. An 'ALM' indicator is located at the bottom left.</p>	
Load voltage range	4.75 to 5.25VDC/10.8 to 26.4VDC (selectable with internal switch)		
Input port	No. of input points		16 points
	Rated input current		7/4/9 mA (5/12/24 VDC)
	Input impedance		0.7k ohms [TYP.](5 VDC) 2.5kohms [TYP.](12/24 VDC)
	Input ON level (active low input)		(Power voltage-1.2)V/3mA or less *Note 2
	Input OFF level (active low input)		1V or open/0.4mA or more *Note 2
	Response time		OFF to ON: 1 ms or less, ON to OFF: 1ms or less
Output port	No. of input points		16 points
	Rated output current		DC 50 mA/point(5 VDC), DC 100 mA/point(12/24 VDC)
	Allowable surge current		1A (10ms or less) *Note 4
	Fuse ratings		For output load current (one for each common), Class-B, normal blow miniature fuse with 2A rating. External power source circuit Class-B, normal blow miniature fuse with 300mA rating.
	ON voltage		0.4 V or less
	Leakage current		0.1mA or less
	Response time		OFF to ON: 1 ms or less, ON to OFF: 1ms or less
Internal current consumption (5 VDC)	Max. 320 mA, n points at ON \rightarrow $(180+5nIN+3.5nOUT)mA$		
External power source	4.75 to 26.4 VDC (Input) max. 12mA/point, (Output) max. 5mA/point		
Operation indication	LED lights at ON condition		
External wire connection system	40-pin connector (soldering) (Applicable wire size : 0.3mm ² or less)		
Dielectrical strength	1500 VAC for 1 minite (between I/O terminal and secondary circuit)		
Insulation resistance	500 VDC, 10M ohms or more (between I/O terminal and secondary circuit)		
Insulation system	By photo-coupler		
Common system	1 common line for input 16 points 1 common line for output 16 points		
Weight	Approx. 800g		
Circuit diagram	<p>The circuit diagram illustrates the internal components. It shows a power supply section with a 5/12/24 VDC input, a fuse, and a switch (SW3-2) for active low selection. The input stage uses photo-couplers (A1, A2, A3, A4, A5, A6, A7, A8, A9, A10) and switches (SW1, SW2) to drive input indicators. The output stage uses photo-couplers (B1, B2, B3, B4, B5, B6, B7, B8, B9, B10) and a common line to drive output indicators. An alarm indicator (ALM) is also shown.</p>

WFL	Write file register (file 1)	<p>Command +data: W F L File register address 1 (6 characters) File register address 2 (6 characters) Data 1 (1 byte) Data (n-1) (1 byte) Data n (1 byte)</p> <p>Response: W F L File register address 1 (6 characters) File register address 2 (6 characters)</p>
WFLF	Write file register (file 1 to 7)	<p>Command +data: W F L F ① File register address 1 (6 characters) File register address 2 (6 characters) Data 1 (1 byte) Data (n-1) (1 byte) Data n (1 byte) ① File numbers 1 to 7</p> <p>Response: R F L F ① File register address 1 (6 characters) File register address 2 (6 characters)</p>
WSM	Write system memory	<p>Command +data: W S M System memory address 1 (4 characters) System memory address 2 (4 characters) Data 1 (1 byte) Data 2 (1 byte) Data n (1 byte)</p> <p>Response: W S M System memory address 1 (4 characters) System memory address 2 (4 characters)</p>
WPM	Write program memory	<p>Command +data: W P M Program memory address 1 (6 characters) Program memory address 2 (6 characters) Data 1 (2 bytes) Data (n-1) (2 bytes) Data n (2 bytes)</p> <p>Response: W P M Program memory address 1 (6 characters) Program memory address 2 (6 characters)</p>

Command	Function	Communication data format
CTC	Change timer/ counter value	Command +data: C T C Program memory address 1 (6 characters) Data (2 bytes) Response: S R R Program memory address 1 (6 characters)
SDY	Set date (for JW-PC only)	Command +data: S D Y Year (H) Year (L) Month (H) Month (L) Date (H) Date (L) Day (H) Day (L) Response: S D Y
STM	Set time (for JW-PC only)	Command +data: S T M Hour (H) Hour (L) Min. (H) Min. (L) Sec. (H) Sec. (L) Response: S T M
ACL	Correct or stop clock (for JW-PC only)	Command +data: A C L ① ①: Contents of correction 01: Stop clock 08: Correct 30 sec. Response: A C L

(Note 1) Commands and response construct below the format. Refer to ZW-10CM, JW-10CM instruction manual and page 123 in this user's manual.

[3] Control commands (see note 1 on previous page)

Command	Function	Communication data format
HLT	Stop PC run	Command: H L T Response: H L T
RUN	Resume PC run	Command: R U N Response: R U N
MPC	Monitor PC run	Command: M P C Response +data: M P C 0 to 2 (1 byte) 0: Running 1: Stopped by other option 2: Stopped by HLT command
VLM	Read memory capacity	Command: V L M Response +data: V L M 0 to 3 (1 byte) Program capacity: 0: 7.5 K words 1: 15.5 K words 2: 23.5 K words 3: 31.5 K words
SVL	Set memory capacity	Command +data: S V L 0 to 5 (1 byte) 0 to 3 (1 byte) Response: S V L Program capacity: 0: 7.5 K words 1: 15.5 K words 2: 23.5 K words 3: 31.5 K words
SWE	Read write mode	Command: S W E Response +data: S W E 0 to 2 (1 byte) 0: Write inhibit 1: Enable data memory write 2: Enable all memory write
EWR	Set write mode	Command +data: E W R 0 to 2 (1 byte) Response: E W R 0: Write inhibit 1: Enable data memory write 2: Enable all memory write

(Note 2) The format of error response
